Presentation example LME7

PME73.820Ax

Program module for burner control LME73.000Ax

User Documentation

Application:

- 1-stage without actuator
- 1-stage or 2-stage or modulating, directly ignited forced draft burners
- Integrated actuator control (can be parameterized) via 3-position controller
- Integrated valve proving (can be parameterized)
- Prepurge position in high-fire or low-fire
- E.g. for burners to EN 676

The PME7 and this User Documentation are intended for use by OEMs which integrate the LME7 with PME7 in their products.

Note

This documentation is only valid together with LME7 Basic Documentation (P7105)!

2 Warning notes

Warning!

The safety, warning and technical notes given in the Basic Documentation on the LME7 (P7105) apply fully to the present document also!

To avoid injury to persons, damage to property or the environment, the following warning notes must be observed!

The LME7 are safety devices! Do not open, interfere with or modify the unit. Siemens does not assume responsibility for damage resulting from unauthorized interference!

Warning!

On the OEM access level of the LME7, it is possible to make parameter settings that differ from application standards. When setting the parameters, it is important to ensure that the application will run safely in accordance with legal requirements. Failure to observe this information poses a risk of damaging the safety functions.

Warning!

Risk of damage to the switching contacts!

If the external primary fuse (Si) is blown due to overload or short-circuit at the terminals, the LME7 must be replaced.

3 Typographical conventions

Safety notes

This User Documentation contains notes which must be observed to ensure your personal safety and to protect the product and the connected equipment. The instructions and notes are highlighted by warning triangles-or a hand symbol and are presented as follows, depending on the hazard level:

	٨	
L	!	7

Warning

means that death, severe personal injury or substantial damage to property **can** occur if adequate precautionary

measures are not taken

Note

draws your attention to **important information** on the product, on product handling, or to a special part of the documentation

Qualified personnel

Only **qualified staff** are allowed to install and operate the equipment. Qualified staff in the context of the safety-related notes contained in this document are persons who are authorized to commission, ground and tag devices, systems and electrical circuits in compliance with established safety practices and standards.

Correct use

Note the following:

The device may only be used on the applications described in the technical documentation and only in connection with devices or components from other suppliers that have been approved or recommended by Siemens.

The product can only function correctly and safely if shipped, stored, set up and installed correctly, and operated and maintained as specified.

Fuel trains (examples)

6.1 Gas direct ignition (G), 1-stage

Figure 3: Fuel train gas direct ignition (G), 1-stage

Gas direct ignition 1 (G), 2-stage

Figure 4: Fuel train gas direct ignition 1 (G), 2-stage

Gas direct ignition 1 (G), 1-stage, with valve 6.3 proving

Figure 5: Fuel train gas direct ignition 1 (G), 1-stage, with valve proving

6.4 Gas direct ignition (G), 2-stage, with valve proving

Figure 6: Fuel train gas direct ignition (G), 2-stage, with valve proving

Note:

When valve proving is activated (e.g. on shutdown), the load on the valve's terminals is restricted.

Fuel valve V1 terminal X7-04 pin 4/fuel valve terminal V2 X7-02 pin 3

If the terminal load is not reduced (max. rated current 2 A, $\cos \varphi > 0.4$), the design lifetime will be reached after about 100,000 burner startup cycles!

7 Gas valve proving

Valve proving is dependent on parameter 241. Valve proving is employed to detect leaking gas valves and, if necessary, to prevent the gas valves from opening or ignition from being switched on. A non-volatile lockout will be initiated in these cases.

Valve proving with separate pressure switch

Fig. 7: Valve proving with separate pressure switch

Step 1: td4 - test space evacuating.

Gas valve on the burner side is opened to bring the test space to atmospheric pressure.

Step 2: td1 - Test time atmospheric pressure

When the gas valve has closed, the gas pressure in the test space must not exceed a certain level.

Step 3: td3 - test space filling.

Gas valve on the mains side opens to fill the test space.

Step 4: td2 - Test time gas pressure

When the gas valve has closed, the gas pressure in the test space must not drop below a certain level.

Legend	
td1	Test time atmospheric pressure
td2	Test time gas pressure
td3	Test space filling
td4	Test space evacuating
Vx	Fuel valve
P LT	Pressure switch valve proving
	Input/output signal 1 (ON)
	Input/output signal 0 (OFF)
	Permissible signal 1 (ON) or 0 (OFF)

Query logic of gas pressure switch for gas valve proving:

- Gas pressure present → pressure switch closed
- Gas pressure not present → pressure switch open

Valve proving can be parameterized to take place on startup, shutdown, or both.

Recommendation:

Perform valve proving on shutdown.

No.	Parameter
241.00	Valve proving
	0 = OFF
	1 = ON 1)
242	Valve proving - test space evacuating
243	Valve proving - test time atmospheric pressure
244	Valve proving - test space filling
245	Valve proving - test time gas pressure

¹⁾ Valve proving during postpurging, if parameter 234 >0 (postpurge time) and parameter 241.01 = 1

Program sequence with gas valve proving

During startup

Gas valve proving during startup is performed only after a reset from the lockout position, after power ON, and when parameter 234 = 0 seconds.

In that case, gas valve proving takes place at the same time as prepurging. This means that the prepurge time corresponds to at least the sum of all 4 gas valve proving parameters (242, 243, 244, and 245).

During shutdown

Gas valve proving during shutdown is performed only if the postpurge time >0 (parameter 234 >0). If no postpurge time is parameterized, gas valve proving takes place during startup when prepurging. During shutdown (heat request OFF), it is checked if parameter 241 = 1 (valve proving ON) and parameter 234 ≠ 0 seconds before the fuel valves close. This means that, first, fuel valve V1 is closed. Fuel valve V2 remains open, so that the remaining gas in the test space can be burned. The postpurge time runs at the same time as gas valve proving. This means that the postpurge time corresponds to at least the sum of all 4 gas valve proving parameters (242, 243, 244, and 245).

Prior to postpurging and valve proving, the actuator travels to the high-fire position.

Warning!

The OEM must set the evacuation, filling and test times for atmospheric or mains pressure on every plant in compliance with the requirements of EN 1643. If not observed, there is a risk of impairment of safety functions.

It must be ensured that the 2 test times are correctly set. It is to be checked whether the gas required for the test may be fed into the combustion chamber (on the relevant application). After a reset, unlock, and in the case of aborted or prevented valve proving, the LME7 will perform valve proving the next time it is started up (only when valve proving is activated). In the case of valve proving, prepurging is active during the startup phase, even if it has been deactivated.

Examples of aborted valve proving:

When the safety loop or the start prevention input for gas (containing pressure switchmin) opens during valve proving.

Valve proving - calculation of leakage rate

$$t_{\text{Test}} = \frac{(P_{\text{G}} - P_{\text{W}}) \cdot V \cdot 3600}{P_{\text{atm}} \cdot Q_{\text{Leck}}}$$

QLeck	in l/h	Leakage rate in liters per hour
PG	in mbar	Overpressure between the fuel valves at the beginning of the test phase
PW	in mbar	Overpressure set on the pressure switch (normally 50%
		of the gas inlet pressure)
Patm	in mbar	Absolute air pressure (1013 mbar normal pressure)
V	in I	Volume between the fuel valves (test volume) including valve volume and
		pilot path if present
tTest	in s	Test time

8 Input gas pressure switch-min

Behavior in the event gas pressure switch-min fails (terminal X5-01 pin 2 and pin 3) If gas pressure switch-min fails, safety shutdown is triggered and startup prevented until gas pressure switch-min closes again. During start prevention, the yellow LED is lit and the safety circuit is active. The LME7 is in phase 90.

9 Connection diagram for LME73.000Ax with SQM4

\bigcirc

Note

The connection diagram shown is merely an example which must be verified in the individual case depending on the application!

LR-OPEN	Load controller OPEN position
LR-CLOSED	Load controller CLOSED position
M	Fan motor
NT	Power supply unit
PLT	Pressure switch - valve proving
Pmax	Pressure switch-max
Pmin	Pressure switch-min
POC	Valve closure control (proof of closure)
PV	Pilot valve
QRA	Flame detector
R	Control thermostat or pressurestat
SA	Actuator
SA-KL	Actuator low-fire
SA-NL	Actuator high-fire
SA-R	Actuator feedback
SA-CLOSED	Actuator CLOSED
SA-ZL	Actuator ignition load
SK	Safety Loop
STB	Safety limit thermostat
SV	Safety valve
V1	Fuel valve
V2	Fuel valve
V2a	Fuel valve
Z	Ignition transformer
	Input/output signal 1 (ON)
	Input/output signal 0 (OFF)
	Permissible signal 1 (ON) or 0 (OFF)

16 List of figures

Figure 1: Program sequence for fuel trains G with or without valve proving	5
Figure 2: Program sequence modulating with SQM4x.x1 / SQM4x.x2 / SQM4x.x4 / SQM4x.x5	6
Figure 3: Fuel train gas direct ignition (G), 1-stage	9
Figure 4: Fuel train gas direct ignition 1 (G), 2-stage	9
Figure 5: Fuel train gas direct ignition 1 (G), 1-stage, with valve proving	9
Figure 6: Fuel train gas direct ignition (G), 2-stage, with valve proving	. 10
Fig. 7: Valve proving with separate pressure switch	. 11
Figure 8: Connection diagram for LME73.000Ax with SQM4	. 13
Figure 9: Connection diagram for LME73.000Ax without SQM4	. 14
Figure 10: Inputs and outputs / internal connection diagram	. 17
