# 1 Supplementary documentation

Product type	Designation	Documentation type	Documentation number
LME	Burner control	Environmental declaration	E7105
LME	Burner control	Product range overview	Q7101
LME75/LME76	Burner control	Data sheet	N7156
LME75/LME76	Burner control	Basic documentation	P7156
PME	Program module	Environmental declaration	E7105.1 *)

\*) On request only

## Note!

This document only refers to the product type – not the *product designation*. See the table below for details.

Product type	Product designation
AZL2	Display and operating unit
LFS1	Flame safeguard
QRA7	UV flame detector
QRI	Infrared flame detector
SQN7	Actuator
SQM4	Actuator
SQM5	Actuator
QPL	Pressure switch
AGG3	Connector set
AGG9	Connector set
OCI410	BC interface
ACS410	PC software
ASZ	Potentiometer

## 2 Warning notes

### Warning!

All the safety, warning, and technical notes given in the basic documentation LME75/LME76 (P7156) also apply to this document in full.

To avoid personal injury or damage to property or the environment, the following warning notes must be observed.

The LME75.000Ax is a safety device. Do not open, interfere with or modify the unit. Siemens does not assume responsibility for damage resulting from unauthorized interference!

### Warning!

On the OEM access level of the LME75, it is possible to make parameter settings that differ from application standards. When setting the parameters, it is important to ensure that the application will run safely in accordance with legal requirements. Failure to observe this information poses a risk of damaging the safety functions.

### 3 Typographical conventions

#### Safety notes

This user documentation contains notes that must be observed to ensure your personal safety and to prevent material damage. The instructions and notes are highlighted by warning triangles or a hand symbol and are presented as follows, depending on the hazard level:

##### Warning

Means that death, severe personal injury or substantial damage to property **can** occur if adequate precautionary measures are not taken.

##### Caution

Means that minor personal injury or property damage **can** occur if adequate precautionary measures are not taken.

##### Note

Draws your attention to **important information** on the product, on product handling, or to a special part of the documentation.

#### Qualified personnel

Only **qualified personnel** are allowed to start up and operate the unit. Qualified personnel in the context of the safety-related notes contained in this user documentation are persons who are authorized to commission, ground, and tag units, systems, and electrical circuits in compliance with established safety practices and standards.

#### Correct use

*Note the following:*

The unit may only be used for the applications described in the technical documentation and only in conjunction with devices or components from other suppliers that have been approved or recommended by Siemens.

The product can only function correctly and safely if shipped, stored, set up, and installed correctly, and operated and maintained with care.

## **4 PME75.231Ax program sequence**

### **4.1 For fuel train LO**

- For direct ignited burners, 2-stage, modulating, with actuator
- For direct ignited burners, 1-stage, without actuator

#### 4.1.1 Lockout position, standby, and startup

Parameter	Direct ignition		Post ignition		Actuator	
			With	Without	With	Without
201	0					
271			>0 s	0 s		
272	0					
295			>0 s	0 s		
515.01					1	0

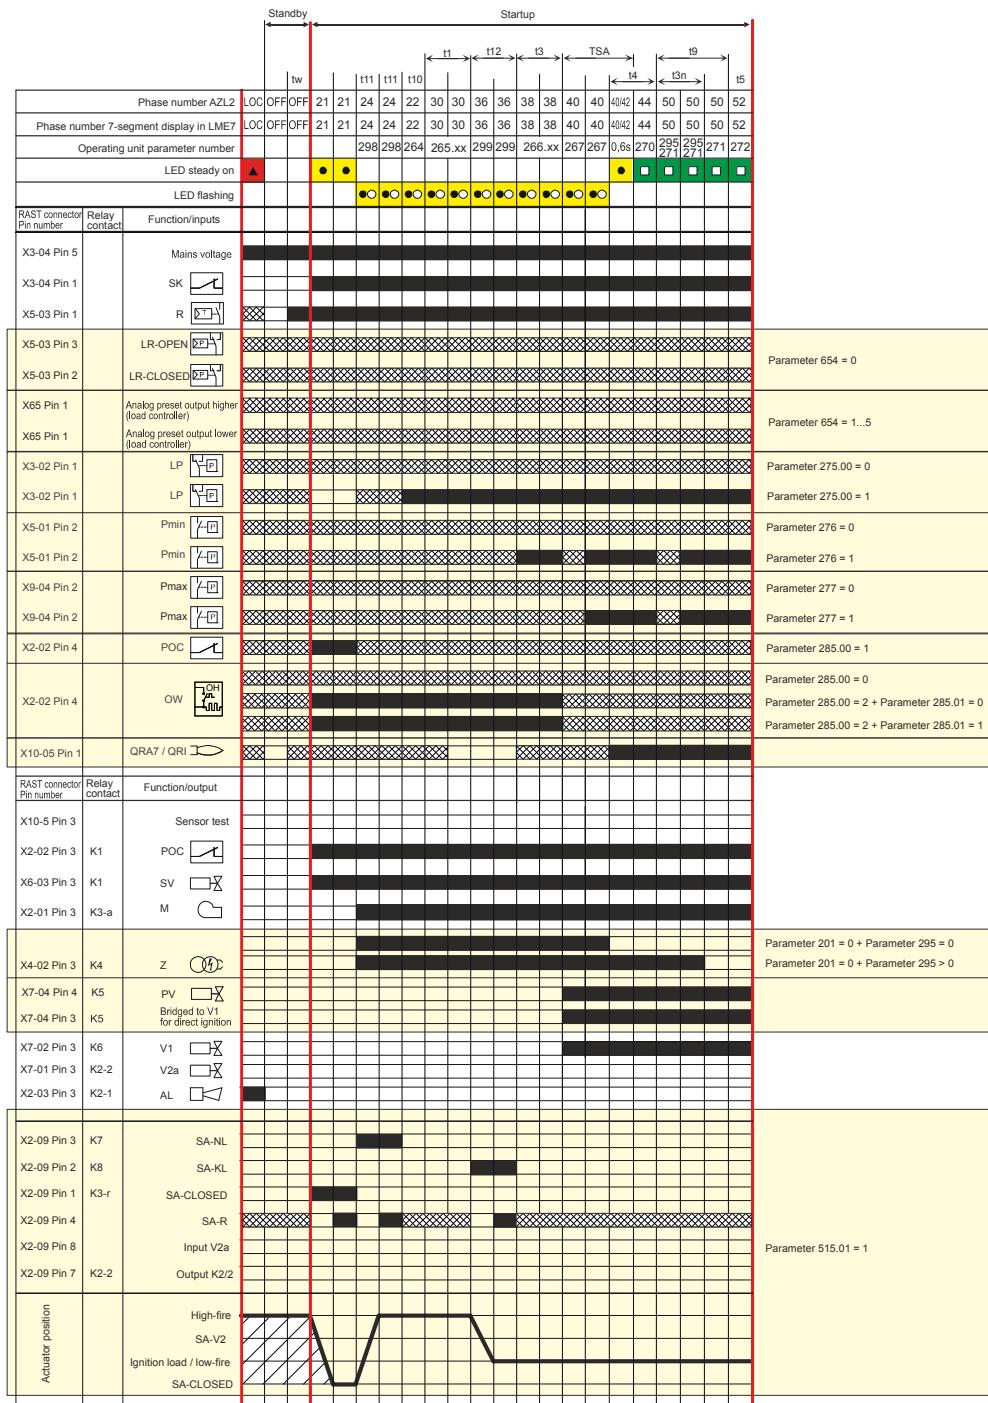

Figure 1: Program sequence for fuel train LO → Lockout position, standby, and startup

#### Note!

Postignition ends once the postignition time ( $t3n$ ) and second safety time ( $t9$ ) have elapsed.

## 4.2 For fuel train L0gp

- For oil burners with gas ignition burner, 2-stage or modulating, with actuator
- For oil burners with gas ignition burner, 1-stage, without actuator

### 4.2.1 Lockout position, standby, and startup

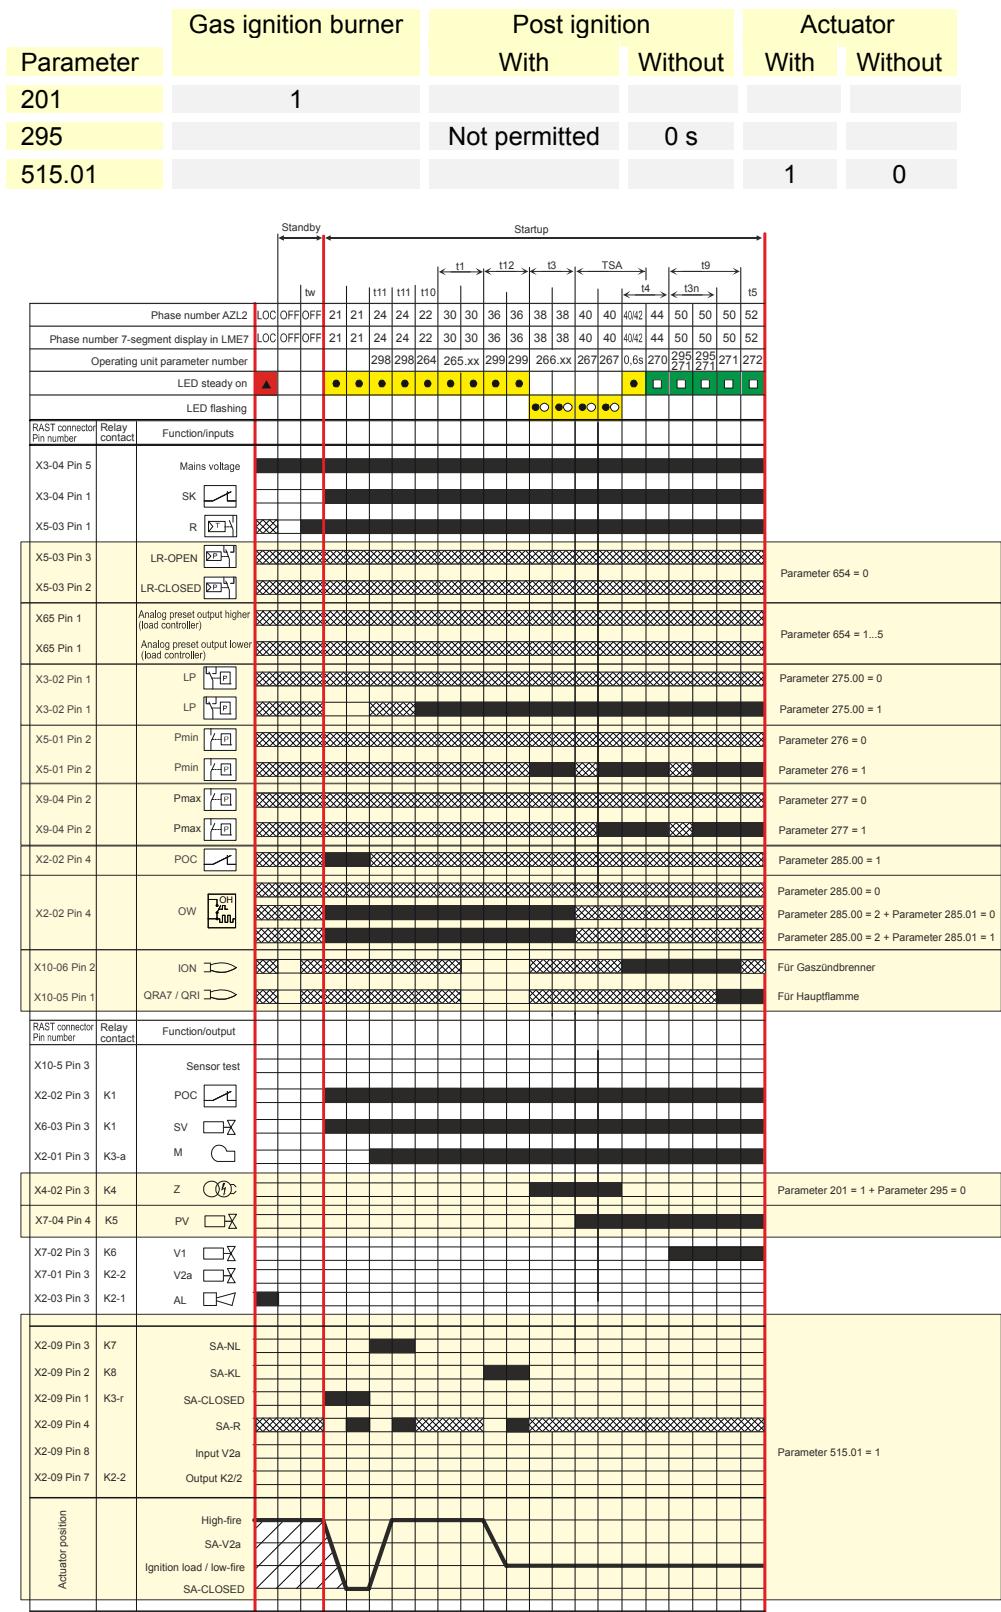

Figure 2: Program sequence for fuel train L0gp → Lockout position, standby, and startup

## 4.3 For fuel train LO + LOgp

### 4.3.1 Multistage operation and shutdown

→ 2-stage operation

→ With actuator

Parameter 563  
Adjustment 1

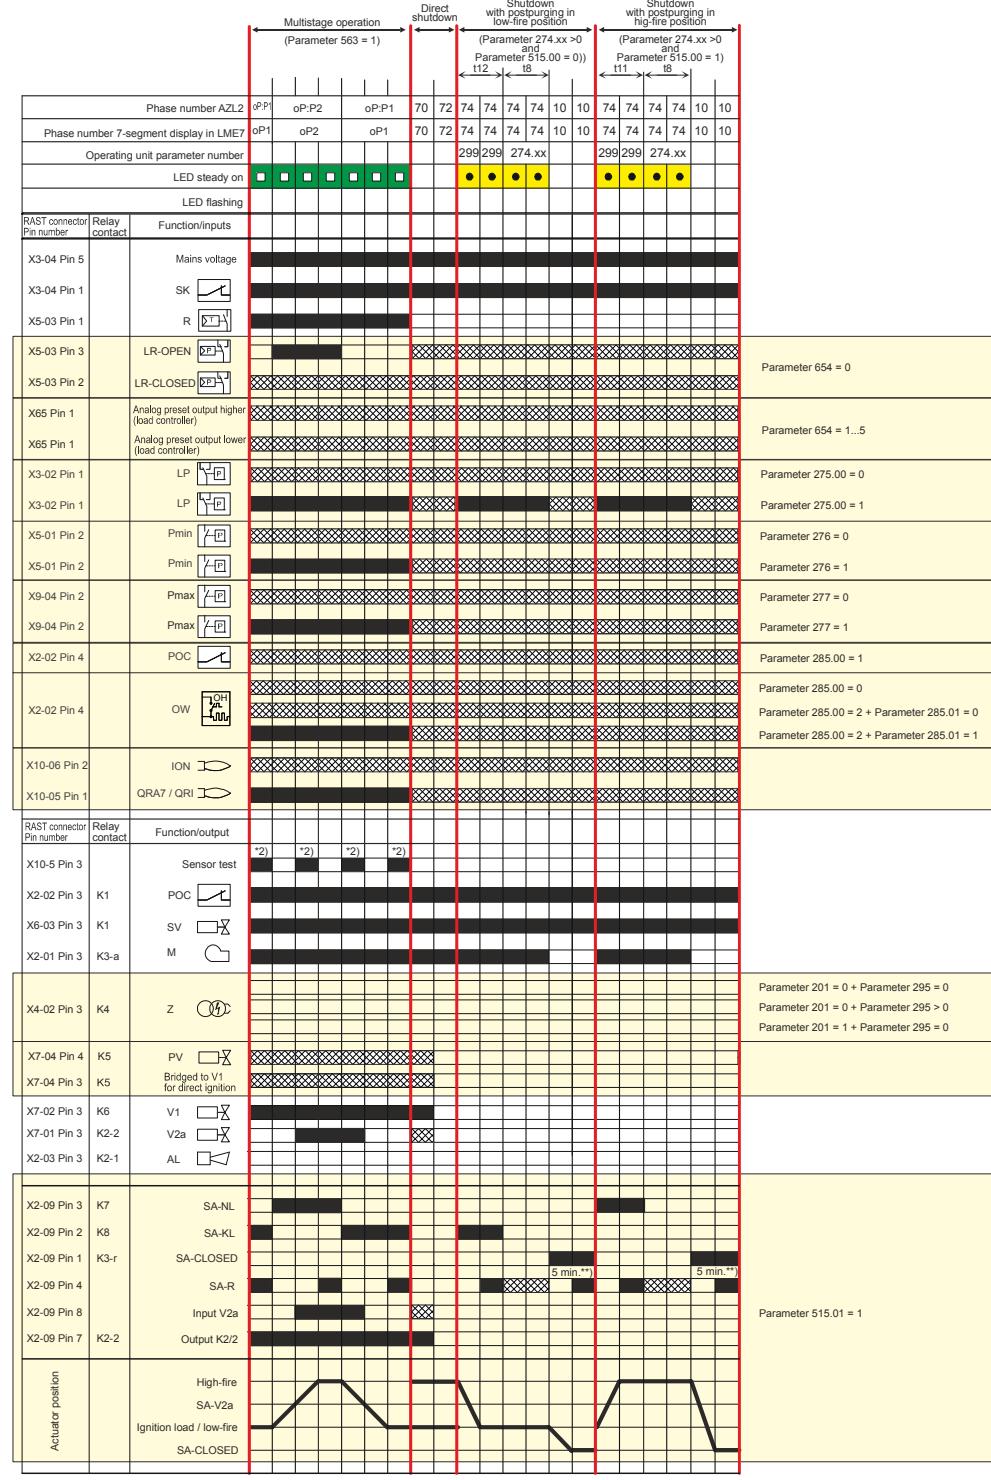

Figure 3: Program sequence for fuel train LO + LOgp → Multistage operation and shutdown

\*\*) Timeout (waiting time) maximum 5 minutes

\*2 Detector test interval 5 seconds / 5 minutes depending on parameter 180

## 4.4 For fuel train LO + LOp

### 4.4.1 Modulating operation and shutdown

→ With actuator

Parameter 563

Adjustment 0

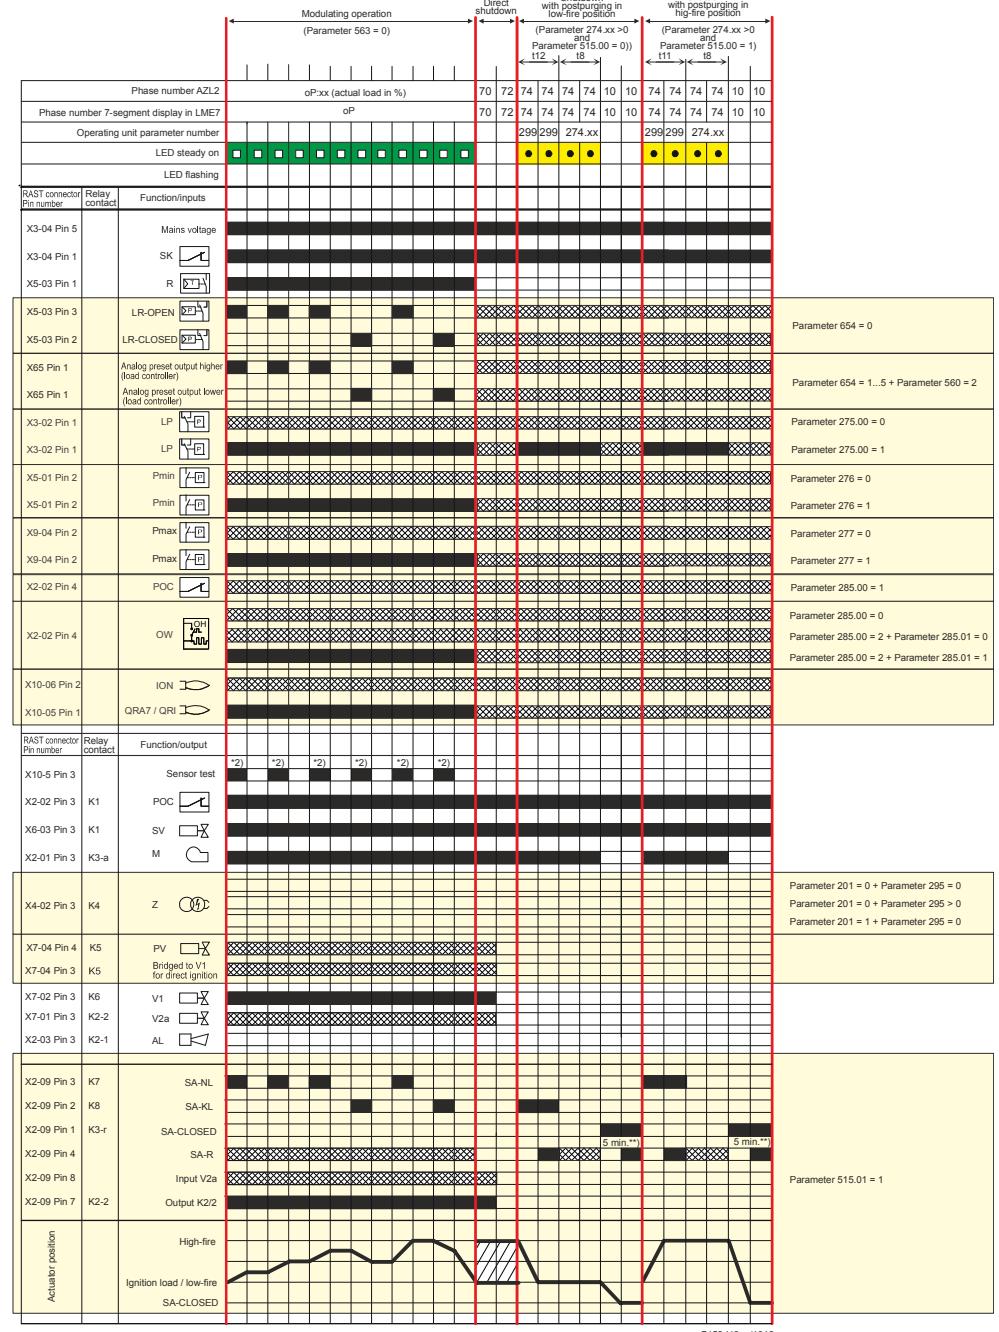

Figure 4: Program sequence for fuel train LO + LOp → Multistage operation and shutdown

\*\*) Timeout (waiting time) maximum 5 minutes

\*2 Detector test interval 5 seconds / 5 minutes depending on parameter 180

## 4.1 For fuel train LO + LOgp

### 4.1.1 Multistage operation and shutdown

→ 1-stage operation

→ Without actuator

Parameter	515.01	560	563
Setting	0	0	0 or 1

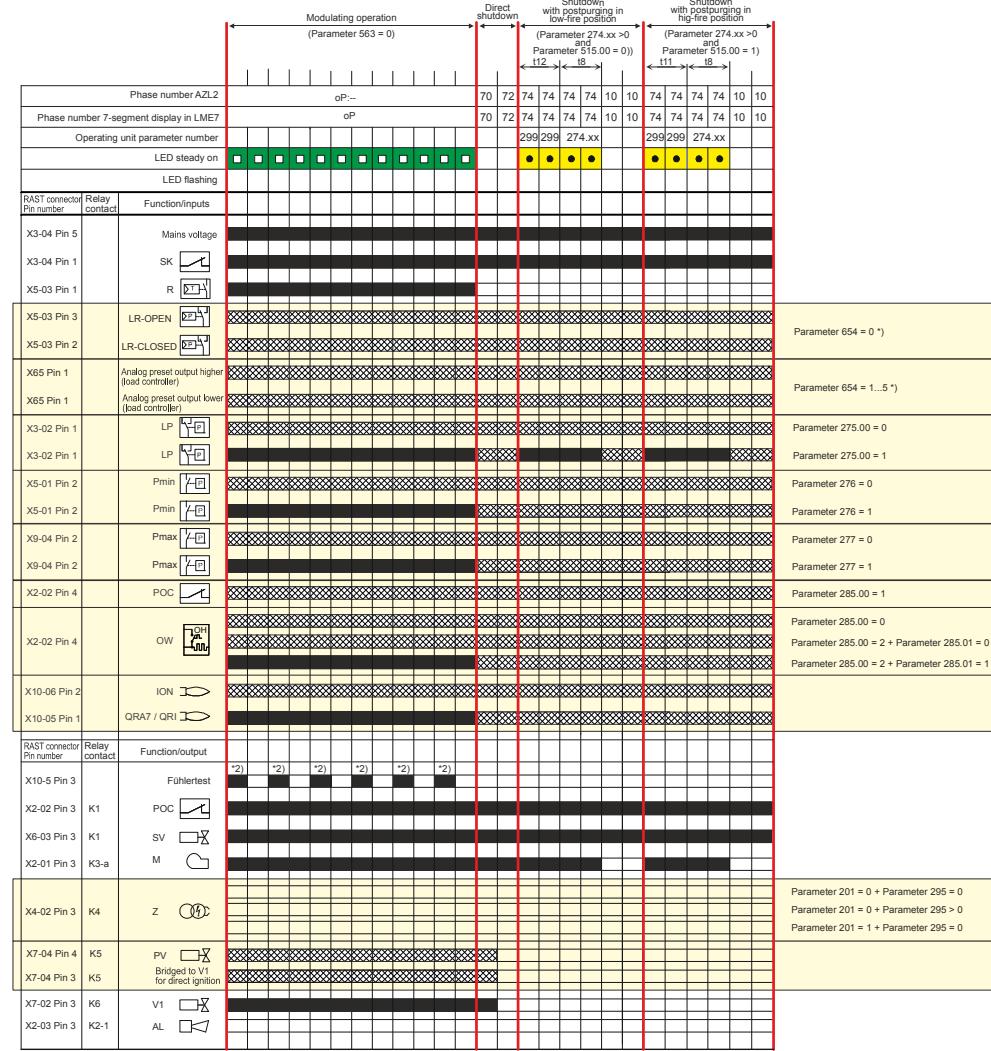

Figure 5: Program sequence for fuel train LO + LOgp → Multistage operation and shutdown

\*2 Detector test interval 5 seconds / 5 minutes depending on parameter 180

#### Note!

Version without actuator control: Parameter 515.01 = 0

\*)

#### Note!

In the case of operation without an actuator, parameter 560 = 0 must be set.

Parameter 654 has no function.

Failure to observe this information results in a non-alterable lockout (Loc: 6).

#### Warning!

Voltage at actuator plug-in space X2-09!

A suitable cover provided by the OEM must provide protection against electric shock hazard at plug-in space X2-09. In terms of design, stability, and protection, covers must conform to EN 60730. Failure to observe this poses a risk of electric shock.

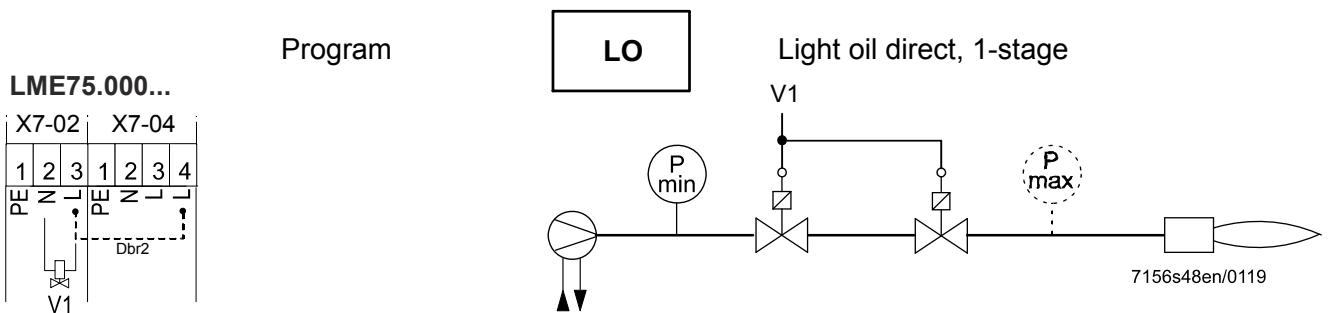

## 5 List of the phase display

Phase number display		LED	Function
7-segment	AZL2		
LOC	LOC	Red	Lockout phase
<b>Standby</b>			
OFF	OFF	OFF	Standby, waiting for heat request
P08	Ph08	OFF	Power ON / test phase (e.g., detector test)
<b>Startup</b>			
P21	Ph21	Yellow	Safety valve ON, air pressure switch in no-load position Actuator travels to CLOSED position
P22	Ph22	Yellow	Gas: Pilot ignition Part 1: Fan motor ON Part 2: Specified time air pressure switch Message (timeout), stabilization air pressure switch
		Flashing yellow	Oil: Direct ignition Part 1: Fan motor ON Part 2: Specified time air pressure switch Message (timeout), stabilization air pressure switch
P24	Ph24	Yellow	Gas: Pilot ignition Actuator travels to the prepurge position (timeout)
		Flashing yellow	Oil: Direct ignition Actuator travels to the prepurge position (timeout)
P30	Ph30	Yellow	Gas: Pilot ignition Part 1: Prepurge time without extraneous light test Part 2: Prepurgung with extraneous light test (1 second)
		Flashing yellow	Oil: Direct ignition Part 1: Prepurge time without extraneous light test Part 2: Prepurgung with extraneous light test (1 second)
P36	Ph36	Yellow	Gas: Pilot ignition Actuator closed in ignition load / low-fire
		Flashing yellow	Oil: Direct ignition Actuator closed in ignition load / low-fire
P38	Ph38	Flashing yellow	Preignition time
P40	Ph40	Flashing yellow	Flame not available First safety time / ignition transformer ON
		Green	Flame available First safety time / ignition transformer ON
P42	Ph42	Yellow	Flame not available Safety time (ignition transformer OFF), flame check
		Green	Flame available Safety time (ignition transformer OFF), flame check
P44	Ph44	Green	Interval: End of safety time and fuel valve V2a ON

Phase number display		LED	Function
7-segment	AZL2		
P50	Ph50	Green	Second safety time, fuel valve V2a ON
P52	Ph52	Green	Interval until release of load controller target (analog or 3-position step input)
P54	Ph54	Green	Parameter 299: Actuator closes at low-fire
Operation			
oP	oP:xx	Green	Modulating operation (parameter 563 = 0) Actual load displayed in percent
oP1	oP:P1	Green	Multistage operation (parameter 563 = 1) First stage
oP2	oP:P2	Green	Multistage operation (parameter 563 = 1) Second stage
Shutdown			
P10	Ph10	OFF	Actuator travels to CLOSED position (home run)
P70	Ph70	Yellow	Stop operation
P72	Ph72	Yellow	Stop operation
P74	Ph74	Yellow	Actuator travels to postpurge position / postpurging
Safety shutdown phases			
P01	Ph01	Yellow/red	Undervoltage/overvoltage
P02	Ph02	Yellow	Safety shutdown, followed by a non-alterable lockout with interlocking or start prevention → e.g., safety loop open
P04	Ph04	Green/red	Extraneous light during burner startup / standby (timeout / locking after 30 seconds)

## 6 Fuel trains (examples)

### 6.1 Direct ignition with light oil (LO), 1-stage

#### Fuel valve control

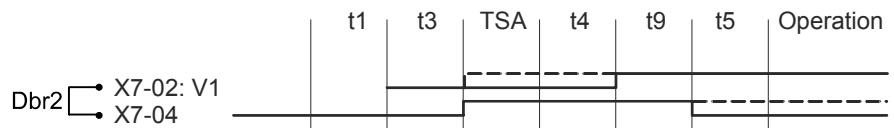

Figure 6: Fuel train direct ignition with light oil (LO), 1-stage

#### Key

— Without Dbr2

- - - With Dbr2

Pmax Pressure switch-max can be activated or deactivated via parameter 277

## 6.2 Direct ignition with light oil (LO), 2-stage

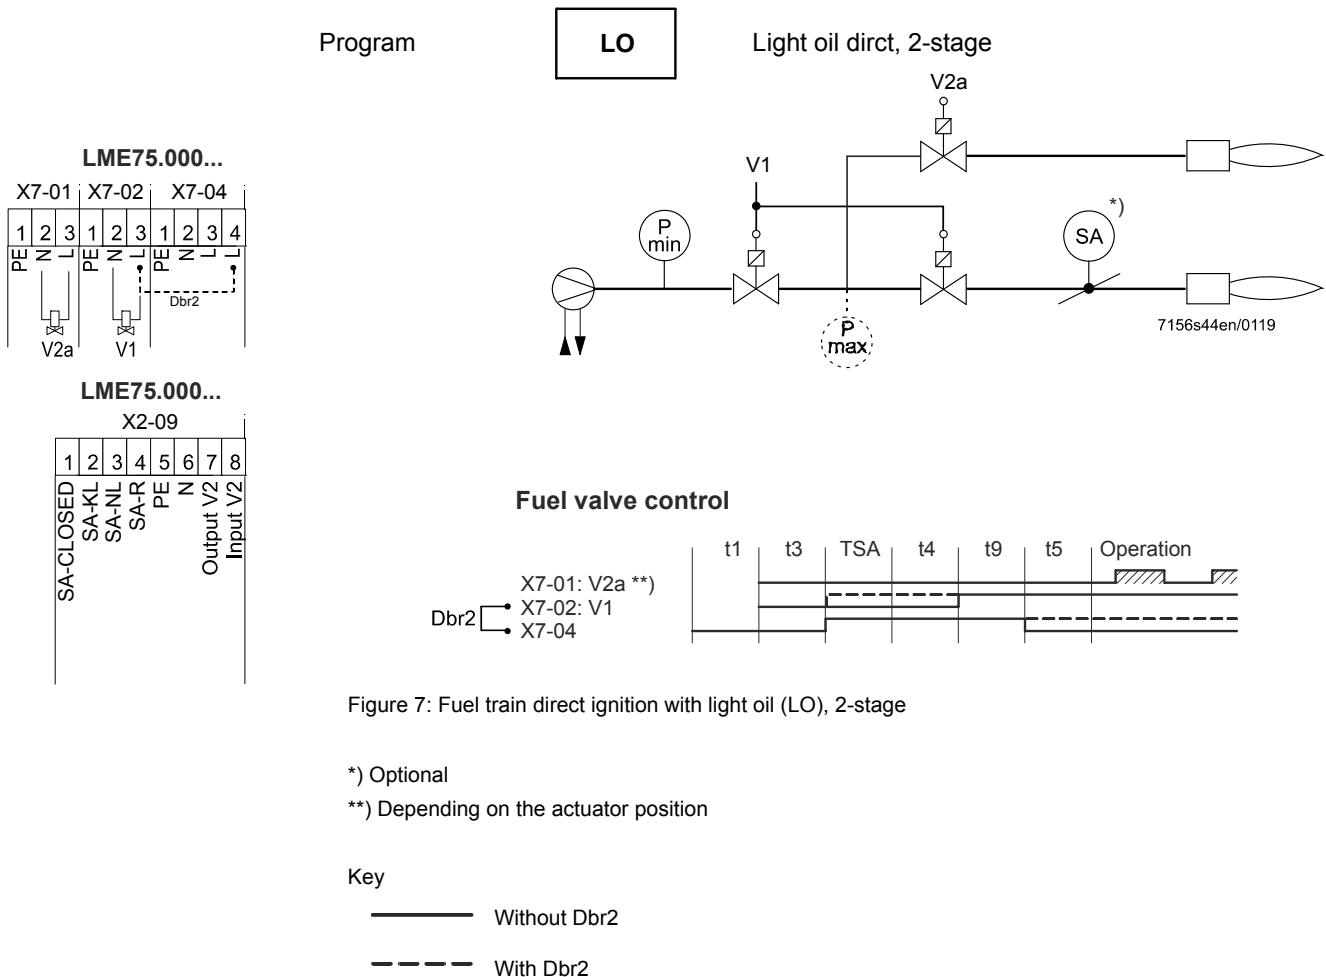

Figure 7: Fuel train direct ignition with light oil (LO), 2-stage

## 6.3 Direct ignition with light oil (LO), modulating, with actuator

### 6.3.1 Without shutdown facility for adjustable head

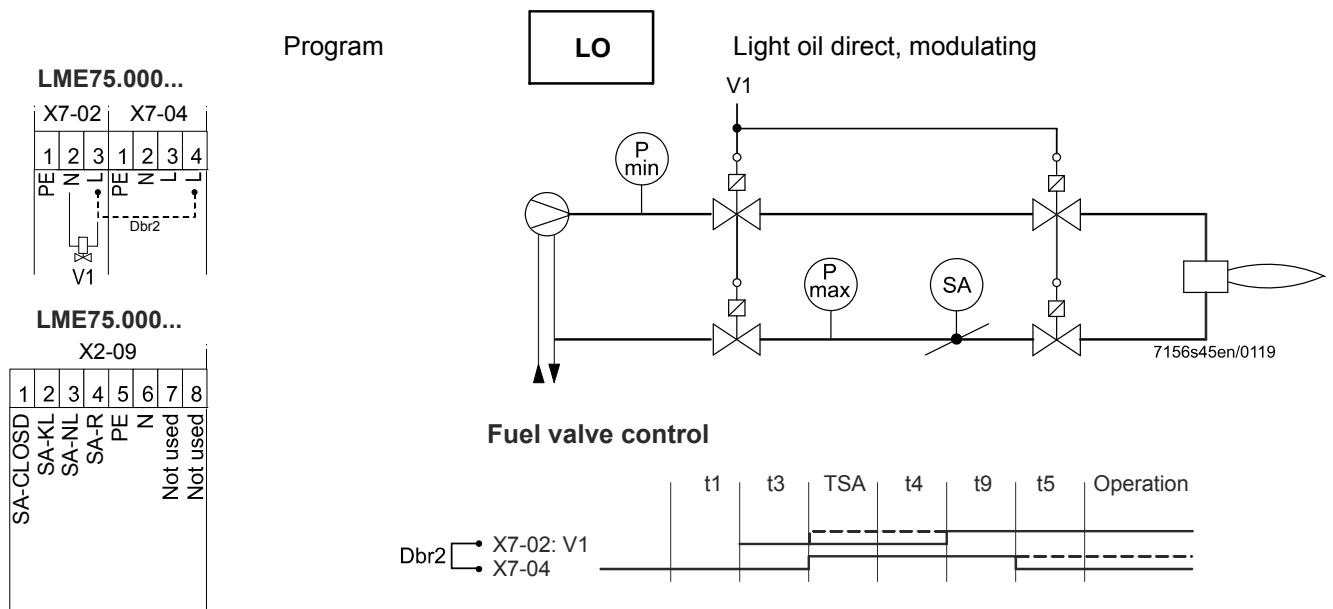

Figure 8: Fuel train direct ignition with light oil (LO), modulating, with actuator, without shutdown facility for adjustable head

### 6.3.2 With shutdown facility for adjustable head

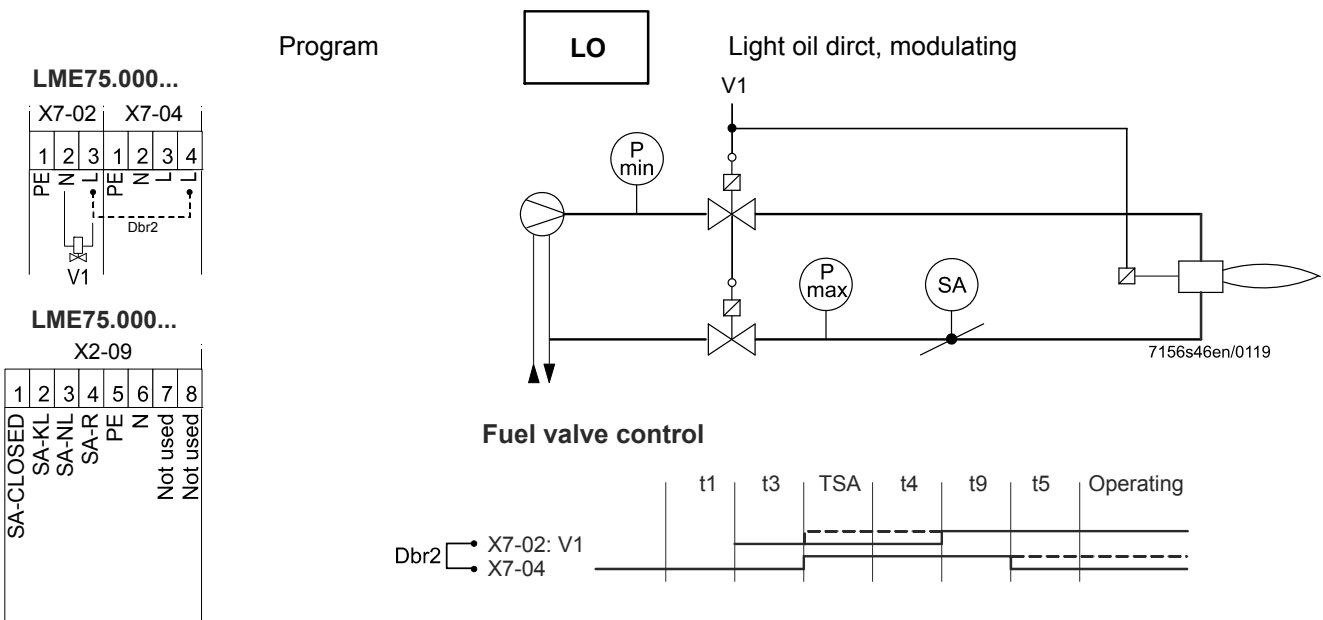

Figure 9: Fuel train direct ignition with light oil (LO), modulating, with actuator, with shutdown facility for adjustable head

## 6.4 Light oil with gas pilot burner (LOgp) (in accordance with EN 676)

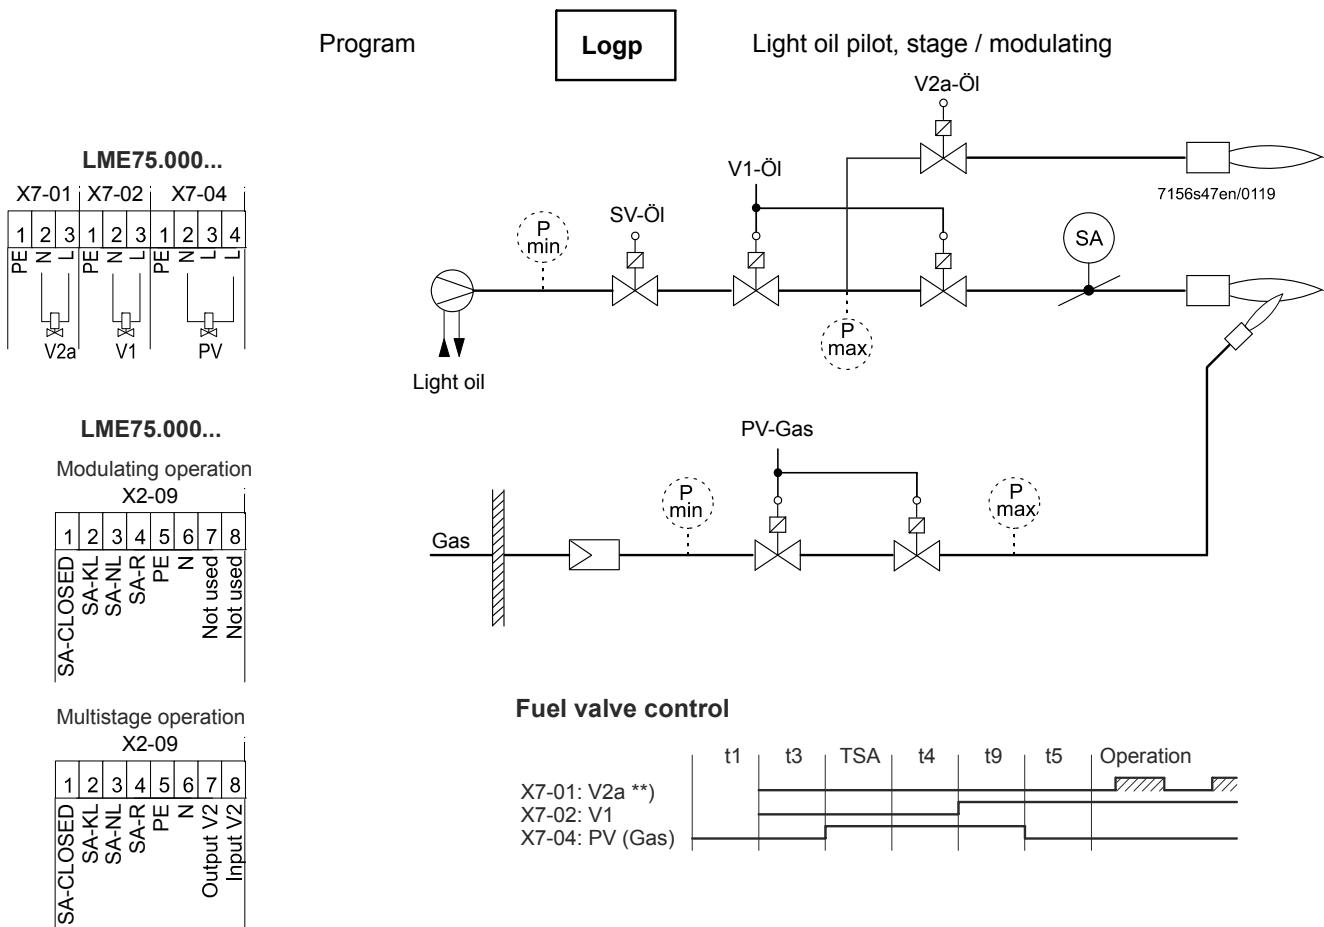

Figure 10: Fuel train light oil with gas pilot burner (LOgp) (in accordance with EN 676)

\*\*) Depending on the actuator position

**Key**

— Without Dbr2

- - - With Dbr2

Pmax Pressure switch-max can be activated or deactivated via parameter 277

**Note!**

In the case of 2-stage applications, the switching contact on the connected actuator switches fuel valve V2a on terminal X7-01.

Please note the maximum permissible contact rating for the connected switching cam within the actuator in use, or the maximum permissible contact rating for terminal X7-01:

Rated voltage	120 V AC 50/60 Hz	230 V AC 50/60 Hz
Rated current	1 A	1 A
Power factor	cos $\phi$ > 0.4	cos $\phi$ > 0.4

# 7 Description of inputs on LME75

## Note!

This chapter covers the basic features of the LME75 inputs.

For an exact evaluation and activation of the inputs, see the program sequences in chapter 4 *PME75.231Ax program sequence*.

## 7.1 Air pressure switch terminal X3-02

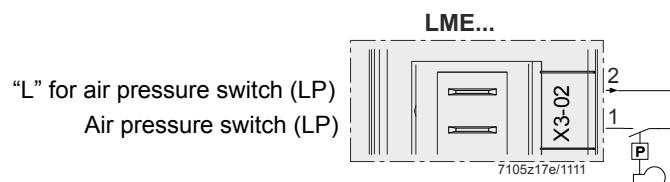

Figure 11: Air pressure switch terminal X3-02

### 7.1.1 Air pressure switch → specified time

Parameter	Function
264	Air pressure switch → specified time

Input for connection of an air pressure switch. The air pressure is anticipated after the fan has been switched on, depending on parameter 264. If no signal is received, this leads to a non-alterable lockout. The air pressure switch must have an NO contact.

### 7.1.2 Air pressure switch input

Parameter	Function
275.00	Air pressure switch input in operation 0 = No evaluation of the air pressure switch 1 = Evaluation of the air pressure switch from fan motor ON

Parameter access: OEM level

Evaluation of the air pressure switch input signal can be changed via the selection in parameter 275.00.

Where parameter 275.00 = 0

No evaluation of the air pressure switch.

Parameter 275.00 = 1

Evaluation of the air pressure switch from phase 22 (fan motor ON).

#### Warning!

The OEM must check to see whether the burner can be operated without an air pressure switch. This may necessitate a special approval depending on the application.

### 7.1.3 Response time to loss of air pressure

Parameter	Function
275.01	Air pressure switch – response time to loss 0 = typically 0.7 seconds $\geq 0$ = additional delay in response to faulty air pressure switch

Parameter access: OEM level

Parameter  $275.01 \geq 0$

Additional delay on loss of air pressure is typically 0.7 seconds + set delay.

Parameter  $275.01 = 0.294$  (factory setting)

The response time to a faulty air pressure switch is  $\leq 1$  second.

Example

Typically  $0.7\text{ s} + 2.758\text{ s} = 2.758\text{ s}$  (corresponds to  $< 3\text{ s}$  according to EN 746-2, chapter 5.2.5.3.4.2 *Maximum safety times for burners without fan*, table 2)

### 7.1.4 Extension of the prepurging

Parameter	Function
265.00	Prepurge time (t1)
265.01	Multiplicator for prepurge time (t1) (extension of the prepurging)

If required, the prepurge time can be extended to  $> 20$  minutes and up to 87 hours. The two parameters 265.00 (prepurge time) and parameter 265.01 (multiplicator for prepurge time) can be used to this end.

The prepurge time corresponds to the time set in parameter 265.00 multiplied by parameter 265.01.

Example for a prepurge time of 1 hour:

Parameter  $265.00 = 1203.048\text{ s} \times \text{parameter } 265.01 = 3$

$\rightarrow 3609.144\text{ s} \sim 60.15\text{ min} \sim 1\text{ h}$

Setting the prepurging to 1 hour can also be achieved with other combinations of the two parameters.

The factory setting is:

Parameter  $265.00 = 24.255\text{ s} \times \text{parameter } 265.01 = 1 \rightarrow 24.255\text{ s}$

## 7.1.5 Extension of the preignition process

Parameter	Function
266.00	Preignition time (t3)
266.01	Multiplicator for preignition time (t3) (extension of the preignition)

If required, the preignition time can be extended to > 75 seconds and up to 5 hours. The two parameters 266.00 (preignition time) and parameter 266.01 (multiplicator for preignition time) can be used to this end.  
The preignition time corresponds to the time set in parameter 266.00 multiplied by parameter 266.01.

Example for a prepurge time of 1 hour:

Parameter 266.00 = 74,97 s x parameter 266.01 = 48  
→ 3598,56 s ~ 59,57 min ~ 1 h

Setting the preignition to 1 hour can also be achieved with other combinations of the two parameters.

The factory setting is:

Parameter 266.00 = 0 s x parameter 266.01 = 1 → Without preignition

## 7.1.6 Extension of the postpurging process

Parameter	Function
274.00	Postpurge time (t8) (no extraneous light test)
274.01	Multiplicator for postpurge time (t8) (extension of the postpurge process)

If required, the postpurge time can be extended to > 20 minutes and up to 87 hours. The two parameters 274.00 (postpurge time) and parameter 274.01 (multiplicator for postpurge time) can be used to this end.  
The prepurge time corresponds to the time set in parameter 274.00 multiplied by parameter 274.01.

Example for a postpurge time of 1 hour:

Parameter 274.00 = 1203.048 s x parameter 274.01 = 3  
→ 3609.144 s ~ 60.15 min ~ 1 h

Setting the postpurging to 1 hour can also be achieved with other combinations of the two parameters.

The factory setting is:

Parameter 274.00 = 19.404 s x parameter 274.01 = 1 → Postpurging >15 seconds

## 7.2 Pressure switch-min terminal X5-01

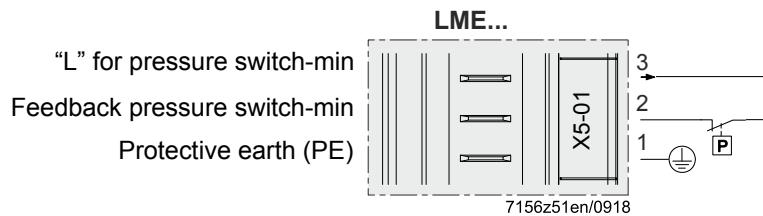

Figure 12: Pressure switch-min terminal X5-01

Parameter	Function
276	Input pressure switch-min 0 = inactive (no evaluation) 1 = active (evaluation from preignition time [t3])

Parameter access: OEM level

### 7.2.1 Evaluation of pressure switch-min input signal

Parameter access: OEM level

Evaluation of the pressure from the *pressure switch-min input signal* can be changed via the selection in parameter 276.

Parameter 276 = 0

Inactive, no signal evaluation takes place.

Parameter 276 = 1

Active, signal evaluation takes place from phase 38 (preignition).

## 7.3 Pressure switch-max terminal X9-04

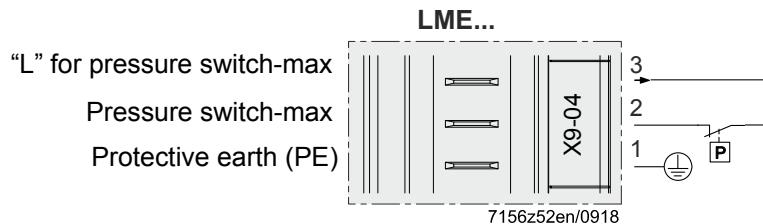

Figure 13: Pressure switch-max terminal X9-04

Parameter	Function
277	Input for pressure switch-max 0 = inactive (no evaluation) 1 = active (evaluation from preignition time [t3])

A pressure switch-max can be connected at input terminal X9-04 pin 2 / pin 3.

Setting the parameter:

Parameter 277 = 1 (input for pressure switch-max)

The pressure switch-max function can be activated by parameter 277 = 1. When the pressure switch-max function is active, the pressure switch-max monitors the maximum pressure and opens if it is exceeded. The monitoring starts after the safety time (TSA). If the maximum pressure is exceeded and the pressure switch-max opens, a non-alterable lockout is performed with lockout code 21.

## 7.4 Flame detector input

### 7.4.1 Ionization probe terminal X10-06

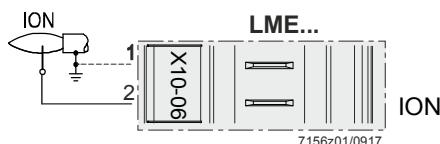

Figure 14: Ionization probe terminal X10-06

Parameter	Function
216	Extraneous light tolerance time in standby
217.00	Flame signal flame-on response time (extension) (not adjustable) 0 = maximum 1 second with ionization probe, QRA7 or QRI
217.01	Flame signal flame-out response time (extension) 0 = maximum 1 second with ionization probe, QRA7 or QRI $\geq 0$ = additional extension to response to a flame fault
220	Response to extraneous light in standby or extraneous light test in the prepurging 0 = start prevention 1 = non-alterable lockout
280	<ul style="list-style-type: none"> <li>• Flame supervision with ionization probe: Restart at loss of flame during interval (t4) an second safety time (t9)</li> <li>• Flame supervision with QRA7/QRI: Restart at loss of flame during interval (t5) and in operation</li> </ul> 0 = no restart 1 = no restart 2...255 = 1...254 x restart
954.00	Intensity of flame for ionization probe (0...100%)

Response time

Parameter access: OEM level

Parameter 217.01 = 0

The response time to a flame fault (flame fault response time) is  $\leq 1$  second.

Parameter 217.01  $\geq 0$

Additional delay on flame fault (flame fault response time) is 1 second + set delay.

Example

$1\text{ s} + 1.911\text{ s} = 2.911\text{ s} \sim 3\text{ s}$  (e.g., EN 746-2, chapter 5.2.5.3.4.2 *Maximum safety times for burners without fan*, table 2)

#### Caution!

 Ensure the correct polarity of the ionization probe connecting wires.  
If connected incorrectly to terminal X10-05, there is a risk that the LME75 and ionization probe may malfunction.

#### Note!

Please observe the requirements outlined in standard EN 267, chapter 4.5.6.2, with regard to flame supervision. If the gas pilot burner and the main burner each have their own flame supervision equipment, the ionization probe may only be used to supervise the flame in the gas pilot burner (in accordance with EN 676). The flame in the main burner is supervised by means of the optical flame supervision with QRA7/QRI.

## 7.4.2 QRA7/QRI terminal X10-05

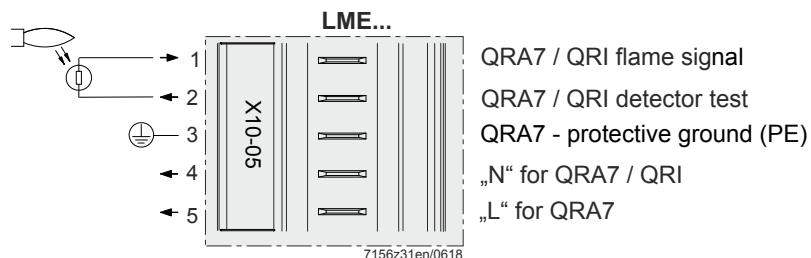

Figure 15: QRA7/QRI terminal X10-05

Parameter	Function
180	Test interval for flame detector QRA7/QRI 0 = $\leq$ 5 minutes 1 = $\leq$ 5 seconds
216	Extraneous light tolerance time in standby
217.00	Flame signal flame-on response time (extension) (not adjustable) 0 = maximum 1 second with ionization probe, QRA7 or QRI
217.01	Flame signal flame-out response time (extension) 0 = maximum 1 second with ionization probe, QRA7 or QRI $\geq$ 0 = additional extension to response to a flame fault
220	Response to extraneous light in standby or extraneous light test in the prepurging 0 = start prevention 1 = non-alterable lockout
280	<ul style="list-style-type: none"> <li>Flame supervision with ionization probe: Restart at loss of flame during interval (t4) an second safety time (t9)</li> <li>Flame supervision with QRA7/QRI: Restart at loss of flame during interval (t5) and in operation</li> </ul> 0 = no restart 1 = no restart 2...255 = 1...254 x restart
954.01	Intensity of flame QRA7/QRI (0...100%)

Response time

Parameter access: OEM level

Parameter 217.01 = 0

The response time to a flame fault (flame signal flame-out response time) is  $\leq 1$  second.

Parameter 217.01  $\geq 0$

Total delay time to flame fault (flame signal flame-out response time, extension) is 1 seconds + set delay.

Example

$1\text{ s} + 1.911\text{ s} = 2.911\text{ s} \sim 3\text{ s}$  (e.g., EN 746-2, chapter 5.2.5.3.4.2 *Maximum safety times for burners without fan*, table 2)

**Caution!**

**Ensure the QRA7/QRI connection wires are connected properly and in-phase. If connected incorrectly to terminal X10-05, there is a risk that the LME75 and QRA7/QRI may malfunction.**

**Note!**

Please observe the requirements outlined in standard EN 267, chapter 4.5.6.2, with regard to flame supervision.

Only optical flame supervision with QRA7/QRI may be used for directly ignited burners.

For burners with a separate gas pilot burner (in accordance with EN 676), the flame in the gas pilot burner and the flame in the main burner can be supervised together by means of optical flame supervision with QRA7/QRI.

**OR**

If the gas pilot burner and the main burner each have their own flame supervision equipment, the ionization probe must be used to supervise the flame in the gas pilot burner.

The flame in the main burner must be supervised by means of the optical flame supervision with QRA7/QRI.

Test interval for continuous operation

Parameter access: OEM level

The interval for testing the QRA7/QRI for continuous operation can be changed via the selection in parameter 180.

Parameter 180 = 0

The flame detector test in the operating position is triggered every 5 minutes.

Parameter 180 = 1

The flame detector test in the operating position is triggered every 5 seconds.

Parameter	Function
180	Test interval for flame detector QRA7/QRI 0 = ≤5 minutes 1 = ≤5 seconds

**Warning!**

**Risk of mixing up with LME71/LME73.**

**Only QRA7 or QRI may be connected to connection terminal X10-05.**

**Only an ionization probe may be connected to connection terminal X10-06.**

**Failure to observe this information poses a risk of loss of device functions or a fault in the LME75 equipment.**

**Warning!**

**The QRA7 input is not short-circuit-proof.**

**A short circuit in terminal X10-05 pin 2 to ground can destroy the QRA7 input.**

**Failure to observe this information poses a risk of loss of device functions.**

**Warning!**

**It is not permitted to connect the LFS1. Failure to observe this information poses a risk of damaging the LME75.**

**Note!**

If an ionization probe is operated simultaneously with a QRA7 or QRI, be sure to note the parameter settings.

## 7.5 Limitation of restarts

Parameter	Functions
280	<ul style="list-style-type: none"><li>• Flame supervision with ionization probe: Restart at loss of flame during interval (t4) and second safety time (t9)</li><li>• Flame supervision with QRA7/QRI: Restart at loss of flame during interval (t5) and in operation</li></ul> <p>0 = no restart 1 = no restart 2...255 = 1...254 x restart</p>

### 7.5.1 Restart in the event of loss of flame

If the main flame is lost during interval (t5) or operation, or the pilot flame during interval (t4) or the second safety time (t9), several restarts per controlled startup can be performed via the control thermostat or pressurestat, or else a non-alterable lockout will be initiated.

With restarts from the operating position (loss of flame), the flame must have been established on completion of the safety time, or else a non-alterable lockout will be initiated.

## 7.6 Logical combination and evaluation of the flame signal inputs for the ionization probe and QRA7/QRI

Parameter access: OEM level

The two flame signal inputs (ionization probe and QRA7/QRI) are *logically* combined or evaluated depending on the program phases.

### Note!

An **OR** operation is always used for extraneous light detection in the startup or standby phases.

This means that, as soon as a flame signal is detected at one of the two flame signal inputs during extraneous light detection (phase 30), a non-alterable lockout is performed (Loc: 4).

At the end of the first safety time until the end of phase 50, at least one of the two flame signals must be available. If no flame signal has been established at the end of the first safety time, a non-alterable lockout is performed (Loc: 2).

At the end of the second safety time until the end of burner operation (end of phase oP:xx), the flame signal must be available at the QRA7/QRI input. If the flame signal at the QRA7/QRI input extinguishes, a non-alterable lockout is performed (Loc: 7).

If a flame signal is present at the input of the ionization probe, the period from the end of the second safety time to the end of the burner operation (end of phase oP:xx) is not evaluated.

### Note!

Please observe the requirements outlined in standard EN 267, chapter 4.5.6.2, with regard to flame supervision.

Only optical flame supervision with QRA7/QRI may be used for directly ignited burners.

For burners with a separate gas pilot burner (in accordance with EN 676), the flame in the gas pilot burner and the flame in the main burner can be supervised together by means of optical flame supervision with QRA7/QRI.

### OR

If the gas pilot burner and the main burner each have their own flame supervision equipment, the ionization probe must be used to supervise the flame in the gas pilot burner.

The flame in the main burner must be supervised by means of the optical flame supervision with QRA7/QRI.

## 7.7 Behavior in the event of extraneous light

Parameter	Function
216	Extraneous light tolerance time in standby
220	Response to extraneous light in standby or extraneous light test in the prepurging 0 = start prevention 1 = non-alterable lockout

Parameter access: OEM level

The response to extraneous light in standby or during the extraneous light test in the prepurging can be changed using the option in parameter 220.

Parameter 220 = 0

In the event of an extraneous light signal in standby or during the extraneous light test in prepurging, a signal is output via the LED (red/green) and via the 7-segment display (P04) / AZL2 (Ph04).

A safety shutdown and start prevention takes place.

Once the extraneous light signal has been extinguished, a restart is carried out.

Parameter 220 = 1

In the event of an extraneous light signal during the extraneous light test in the prepurging, a non-alterable lockout is performed (Loc: 4).

In the event of an extraneous light signal in standby, a signal is output via the LED (red/green) and via the 7-segment display (P04) / AZL2 (Ph04). Once the extraneous light tolerance time in standby has elapsed, a non-alterable lockout is performed (Loc: 4).

This extraneous light tolerance time can be parameterized by parameter 216 in the range of 0...1237 seconds (factory setting 30 seconds).

## 7.8 Analog input load controller terminal X65

→ Only in modulating operation

### PME75.231Ax

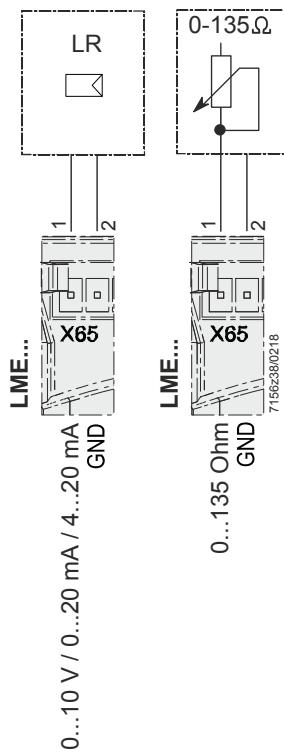

Figure 16: Load controller terminal X65

Parameter	Function
140	Mode display in the 7-segment display 1 = standard (program phase) 2 = flame 1 (ionization) 3 = flame 2 (QRA7/QRI) 4 = active power (power value)
560	Pneumatic combustion control 0 = OFF / 3-position step modulation 1 = PWM fan motor / analog modulation  Note! Setting = 1 No function. This selection puts the LME75 in lockout position.
	2 = Air damper / analog modulation (ASZxx.3x feedback required)
563	Operating mode of the ratio control 0 = modulating 1 = multistage
654	Only with analog modulating (parameter 560 = 2) Analog input (ASZxx.3x feedback required) 0 = 3-position step input 1 = 0...10 V 2 = 0...135 Ω 3 = 0...20 mA 4 = 4...20 mA with a non-alterable lockout at I < 4 mA 5 = 4...20 mA without a non-alterable lockout at I < 4 mA

The following input signals can be selected and handled via parameter 654:

- 3-position step input for modulation with analog signal (feedback ASZxx.3x required / depending on the program sequence)
- 0...10 V
- 0...135 Ω
- 0...20 mA
- 4...20 mA with a non-alterable lockout at  $I < 4$  mA (AZL2: Loc: 60)
- 4...20 mA without a non-alterable lockout at  $I < 4$  mA

Note!

Shielded cables must be used if cables are > 10 m.

Parameter access: Heating engineer level

The function of the analog input *load controller* terminal X65 can be adapted via parameter 654.

Parameter 654 = 0

3-position step input (factory setting)

With this setting, load control takes place solely via the contact inputs for the external load controller terminal X5-03 pin 2 and 3.

Parameter 654 = 1...4

Load control via analog input terminal X65

With this setting, load control takes place via a preset analog value.

An analog signal (terminal X65) is only taken into account in the operating phases (oP). If a signal is present during startup, shutdown, standby, and in the lockout position, it is ignored.

Note!

Load control via analog input terminal X65 always requires an actuator with a built-in potentiometer for position feedback and the analog modulation to be activated (parameter 560 = 2).

The display mode for the internal 7-segment display is defined via parameter 140.

Setting 1 = standard (program phase, factory setting)

Setting 2 = flame 1 (ION)

Setting 3 = flame 2 (QRA7/QRI)

Setting 4 = active power

(power value, only for actuators with a built-in ASZ for position feedback)

## 7.9 External load controller (ON/OFF) terminal X5-03

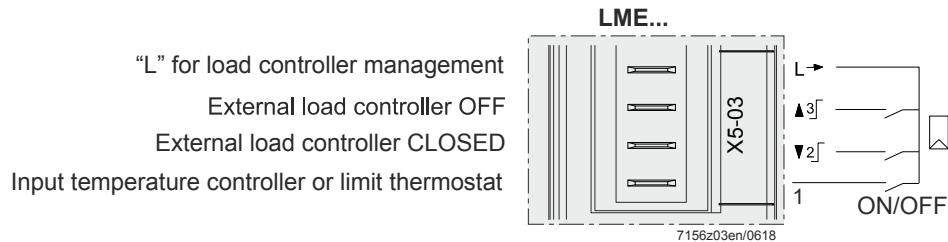

Figure 17: Load controller ON/OFF terminal X5-03

Parameter	Function
272	Interval (t5): Stabilization time main flame
274.00	Postpurge time (t8) (no extraneous light test)
274.01	Multiplicator for postpurge time (t8) (extension of the postpurge process)
515.00	Actuator position during postpurge time (t8) 0 = Purging in low-fire 1 = Purging in high-fire
515.01	Actuator control 0 = OFF 1 = ON  Note! Setting = 0 No actuators may be connected and parameter 560 must be set to 0.
560	Pneumatic combustion control 0 = OFF / 3-position step modulation 1 = PWM fan motor / analog modulation  Note! Setting = 1 No function. This selection puts the LME75 in lockout position.  2 = Air damper / analog modulation (ASZxx.3x feedback required)
563	Operating mode of the ratio control 0 = modulating 1 = multistage
654	Only with analog modulating (parameter 560 = 2) Analog input (ASZxx.3x feedback required) 0 = 3-position step input 1 = 0...10 V 2 = 0...135 Ω 3 = 0...20 mA 4 = 4...20 mA with a non-alterable lockout at I < 4 mA 5 = 4...20 mA without a non-alterable lockout at I < 4 mA

The load controller input is evaluated by making a 2-out-of-3 selection. This means that to trigger a control action via the actuator outputs, an ON or OFF signal must be identified within at least 2 successive cycles. As a result of this sampling process, an ON or OFF signal must be present for a time between minimum 0.3 seconds and maximum 0.45 seconds to produce an output signal change at the LME75.000Ax.

#### Terminal X5-03 pin 1

Heat request (input external temperature controller or limit thermostat):

The burner starts if a signal (L → terminal X5-03 pin 4) is present at pin 1 for a heat request.

The burner shuts down and then enters standby once a heat request (at L → terminal X5-03 pin 4) is no longer present.

### 7.9.1 Shutdown sequence

#### Burner without actuator: Parameter 515.01 = 0

The burner without actuator shuts down and then enters standby once a heat request (at L → terminal X5-03 pin 4) is no longer present.

#### Burner with actuator, without postpurge time (t8):

##### Parameter 274.xx = 0, parameter 515.01 = 1

The burner shuts down in the final actuator position and then enters standby once a heat request (at L → terminal X5-03 pin 4) is no longer present.

#### Burner with actuator, with postpurge time (t8) in low-fire position:

##### Parameter 274.xx > 0, parameter 515.01 = 1, parameter 515.00 = 0

The burner travels the actuator in low-fire position and starts the postpurging according to the time settings in parameter P274.xx. Once the postpurge time is complete, the burner shuts down and then enters standby once a heat request (at L → terminal X5-03 pin 4) is no longer present.

#### Burner with actuator, with postpurge time (t8) in high-fire position:

##### Parameter 274.xx > 0, parameter 515.01 = 1, parameter 515.00 = 1

The burner travels the actuator in high-fire position and starts the postpurging according to the time settings in parameter P274.xx. Once the postpurge time is complete, the burner shuts down and then enters standby once a heat request (at L → terminal X5-03 pin 4) is no longer present.

### 7.9.2 Modulating operation: Parameter 563 = 0

#### Terminal X5-03 pin 2

Load controller CLOSED (input *external load controller CLOSED*)

A signal (L → terminal X5-03 pin 4) at pin 2 is ignored during startup, shutdown, standby, or in the lockout position. If a signal is present in the operating phases (oP), the actuator travels toward the low-fire position. If no signal is present in the operating phases (oP), the actuator stays in the position it has reached.

#### Terminal X5-03 pin 3

Load controller OPEN (input *external load controller OPEN*)

A signal (L → terminal X5-03 pin 4) at pin 3 is ignored during startup, shutdown, standby, or in the lockout position. If a signal is present in the operating phases (oP), the actuator travels toward the high-fire position. If no signal is present in the operating phases (oP), the actuator stays in the position it has reached.

### **7.9.3 Multistage operation: Parameter 563 = 1**

#### **Terminal X5-03 pin 2**

Load controller CLOSED (input *external load controller CLOSED*)

A signal (L → terminal X5-03 pin 4) at pin 2 is ignored during startup, shutdown, standby, or in the lockout position. If a signal is present in the operating phases, it is ignored.

#### **Terminal X5-03 pin 3**

Load controller OPEN or high-fire stage (input *external load controller OPEN*)

A signal (L → terminal X5-03 pin 4) at pin 3 is ignored during startup, shutdown, standby, or in the lockout position. If a signal is present in the operating phase (oP1), the actuator travels to the high-fire position (oP2). If there is no signal present in the operating phase (oP2), the actuator travels to the low-fire position (oP1).

## 7.10 Safety loop terminal X3-04

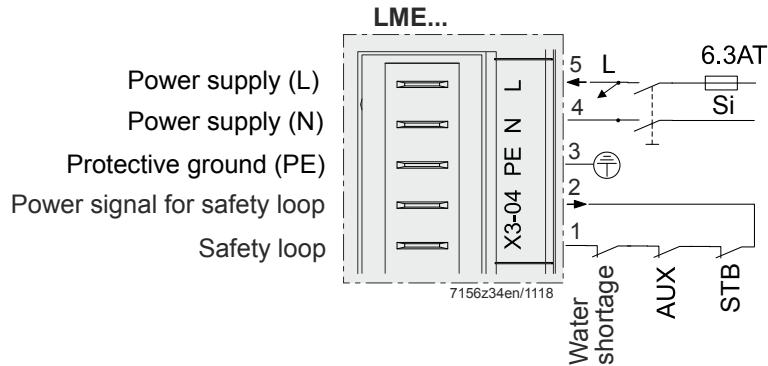

Figure 18: Safety loop terminal X3-04

Parameter	Function
215.00	Response when opening the safety loop (safety loop failure) 0 = safety shutdown and start prevention 1 = safety shutdown followed by non-alterable lockout
215.01	Tolerance time for the <i>safety loop during heat request</i> (start of startup sequence after standby)

Input for the safety loop. When any of the series-connected contacts included in the loop opens, power supply to the fuel valves, the fan, and the ignition is instantly cut.

The following contacts are included in the safety loop:

- Safety limiter / safety pressure limiter
- External limit thermostat and/or pressure switch, if required
- Water shortage switch

Parameter access: OEM level

The response to opening the safety loop can be changed with the options in parameter 215.xx. For diagnostic purposes, the contacts of the safety loop are combined to the message *safety loop*.

Parameter 215.00 = 0

If the safety loop is not closed during a heat request or else opens during operation, a safety shutdown and start prevention take place. If the safety loop is or becomes closed again, a restart takes place.

Parameter 215.00 = 1

If the safety loop opens during operation, a non-alterable lockout is performed (Loc: 22). If the safety loop is not closed during a heat request (load controller ON/OFF at terminal X5-01 pin 3), a non-alterable lockout is performed (Loc: 22) once the tolerance time for the *safety loop during heat request* parameter 215.01 > 0 seconds.

Parameter 215.01 > 0 seconds

If the tolerance time for the safety loop elapses during a heat request, either a safety shutdown or a non-alterable lockout is performed (Loc: 22) depending on parameter 215.00.

**Note!**

The power signal for the safety loop is only active if a heat request (load controller ON/OFF) is present at terminal X5-01 pin 3. In the lockout position, the power signal switches off too.

**Warning!**

**The in-phase connection of the power supply must be observed. Failure to observe this information poses a risk of loss of device functions.**

# 8 Function input/output terminal X2-02

## Note!

This chapter covers the basic features of the function input/function outputs of terminal X2-02. For an exact evaluation and activation of the outputs, see the program sequences in chapter 4 *PME75.231Ax program sequence*.

## 8.1 POC function input

Figure 19: POC function input terminal X2-02

## 8.2 Oil preheater function input / oil temperature limiter function output

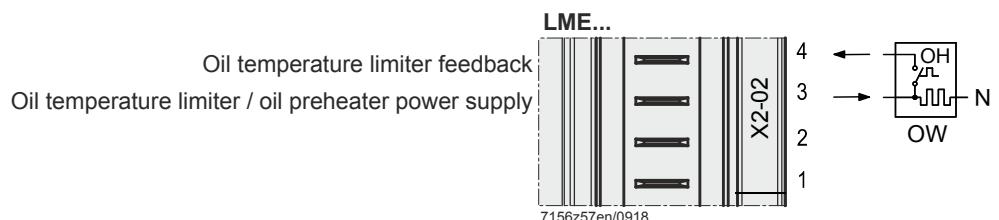

Figure 20: Oil preheater / oil temperature limiter terminal X2-02

Parameter	Function
285.00	Function input terminal X2-02, oil temperature limiter / POC 0 = inactive 1 = POC input (valve closing control) 2 = Oil temperature limiter input
285.01	Evaluation of the oil temperature limiter 0 = inactive during operation 1 = active during operation
296	Oil preheater waiting time (timeout) 600 seconds (factory setting)

Parameter 285.00 defines which function is required.

Function output terminal X2-02 pin 3 serves as a power supply for an oil preheater, oil temperature limiter, or POC (valve closing control).

Parameter access: OEM level

Parameter 285.00 is used to determine the oil temperature limiter or POC (valve closing control) function of the function input terminal X2-02 pin 4.

Parameter 285.01 defines how the oil temperature limiter is tested.

Parameter 285.00 = 0 (factory setting)

Function input terminal X2-02 pin 4 is not evaluated. The function input does not need to be connected.

Parameter 285.00 = 1

Function input terminal X2-02 pin 4 is used as a POC (valve closing control). The fully closed position of the POC is not subject to a safety-relevant check during startup (phase 21). The POC can be replaced with a wire link Dbr1.

The POC contact must be closed after a maximum waiting time of 5 seconds at the start of phase 21.

An incorrect signal from the POC is detected in the corresponding phases and leads to a non-alterable lockout (LOC: 14).

**Warning!**

**Welding the POC contact.**

**If several contacts are connected in series, the valve closure contact (POC) must not be welded in the closed position.**

Parameter 285.00 = 2

Function input terminal X2-02 pin 4 is used to provide feedback from the oil temperature limiter.

The signal for the oil temperature limiter is checked during startup (phases 21...38) and during operation depending on parameter 285.01.

The signal for the oil temperature limiter must be closed, latest after end of the oil preheater waiting time (parameter 296), at the start of phase 21.

Depending on parameter 285.01 = 1, the signal from the oil temperature limiter must also remain closed in the operating position.

An incorrect signal from the oil temperature limiter leads to a non-alterable lockout (LOC: 8).

Parameter 285.01 = 0 (factory setting)

The signal for the oil temperature limiter is evaluated during startup (phase 21...38).

Parameter 285.01 = 1

The signal for the oil temperature limiter is evaluated during startup (phases 21...38) and during the operating phase.

Parameter 296 > 0 seconds (factory setting = 600 seconds)

Oil preheater waiting time (timeout) defines the time frame at the start of the startup sequence (phase 21).

A signal must be issued by the oil temperature limiter by no later than the end of the oil preheater waiting time.

An incorrect signal from the oil temperature limiter leads to a non-alterable lockout (LOC: 8).

# 9 Description of outputs on LME75

## Note!

This chapter covers the basic features of the LME75 outputs. For an exact evaluation and activation of the outputs, see the program sequences in chapter 4 *PME75.231Ax program sequence*.

## 9.1 Fan motor terminal X2-01

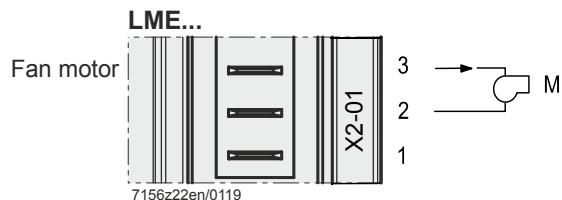

Figure 21: Fan motor terminal X2-01

Output for connection of a fan motor.

## 9.2 Alarm terminal X2-03

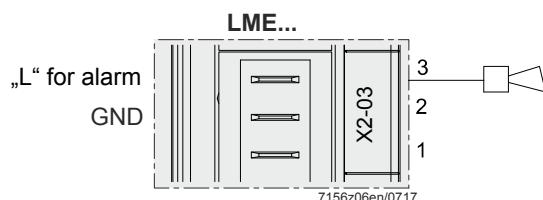

Figure 22: Alarm terminal X2-03

Output for connection of an alarm lamp or horn.  
The output is activated when the LME75 is in the lockout position.

### 9.3 Actuator terminal X2-09

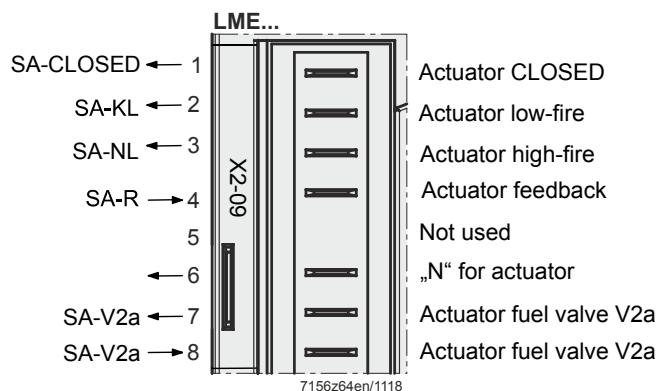

Figure 23: Actuator terminal X2-09

Parameter	Function
123	Minimum load control step
272	Interval (t5): Stabilization time main flame
274.00	Postpurge time (t8) (no extraneous light test)
274.01	Multiplicator for postpurge time (t8) (extension of the postpurge process)
298	Opening time of actuator (timeout)
299	Closing time of actuator (timeout)
515.01	Actuator control 0 = OFF 1 = ON
	<p><b>Note!</b></p>  Setting = 0 No actuators may be connected and parameter 560 must be set to 0.
560	Pneumatic combustion control 0 = OFF / 3-position step modulation 1 = PWM fan motor / analog modulation
	<p><b>Note!</b></p>  Setting = 1 No function. This selection puts the LME75 in lockout position.
	2 = Air damper / analog modulation (ASZxx.3x feedback required)
563	Operating mode of the ratio control 0 = modulating 1 = multistage
654	Only with analog modulating (parameter 560 = 2) Analog input (ASZxx.3x feedback required) 0 = 3-position step input 1 = 0...10 V 2 = 0...135 Ω 3 = 0...20 mA 4 = 4...20 mA with a non-alterable lockout at I < 4 mA 5 = 4...20 mA without a non-alterable lockout at I < 4 mA

The actuators are powered by mains voltage delivered directly via the LME75.

### 9.3.1 Connection of feedback actuator position with ASZ in actuator at terminal X66

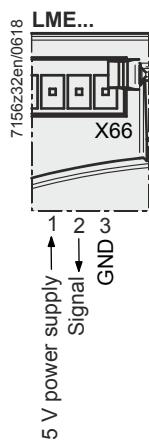

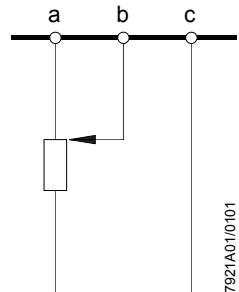

Figure 24: Actuator terminal X66

Type	Terminal X66			Direction of rotation	
	Pin 1 (5 V signal)	Pin 2 (Signal)	Pin 3 (GND)	Clockwise	Clockwise
ASZ	a	b	c	•	---
ASZ	c	b	a	---	•
Terminal ASZxx30 (1 kΩ conductive plastic 90°)					

### 9.3.2 Engineering notes

Connection diagram

ASZ shown in start position.

Terminal markings:  
a = potentiometer end tap  
b = potentiometer wiper  
c = potentiometer end tap

Figure 25: ASZ connection diagram

Apply operating voltage to "a" and "c".

ASZ based on conductive plastic can be destroyed if operating voltage is applied between "a → b" or "b → c".

### 9.3.3 Pin assignment of actuators for terminal X2-09 at LME75

#### 9.3.3.1. SQN70/SQN71

→ See diagram 6 in SQN70/SQN71 data sheet N7804

Terminal X2-09		Wire link Dbr2	Actuator		
Pin	Function		Pin	Cam	Function
1	Travel to CLOSED position		2	II	CLOSED (Wire link in the actuator pin 2 to pin 3)
2	Travel to low-fire position		4	III	Low-fire/ignition load
3	Travel to high-fire position		1	I	High-fire
4	Feedback high-fire position/low-fire position/CLOSED position		5	---	Feedback
5	Free		---	---	---
6	Mains connection neutral (N)		N	---	Neutral
7	Output for fuel valve V2a (second stage power supply)	Pin 7 to pin 8 (for 1-stage applications only)	6	IV	Cam power supply for fuel valve V2a (for 2-stage applications only)
8	Control and feedback for fuel valve V2a (second stage)	Pin 7 to pin 8 (for 1-stage applications only) *)	7	IV	Control for fuel valve V2a (for 2-stage applications only)

\*)

Note!

In 1-stage operation with wire link Dbr2, the external load controller (LR-OPEN) at terminal X5-03 pin 3 must not be actuated. Otherwise a non-alterable lockout is performed (Loc: 6 → Actuator fault)

### 9.3.3.2. SQN72

→ See diagram C in SQN72 data sheet N7802

Terminal X2-09			Actuator		
Pin	Function	Wire link Dbr2	Pin	Cam	Function
1	Travel to CLOSED position		2	II	CLOSED (wire link in the actuator pin 2 to pin 3)
2	Travel to low-fire position		6	III	Low-fire/ignition load

Figure 30: Connection diagram example 3: for LME75.000Ax with PME75.231Ax without actuator

The actuator function can be deactivated using parameter 515.01.

## Parameter access: OEM level

Parameter 515.01 = 0

Actuator deactivated (setting for applications without actuator).

Parameter 515.01 = 1

Actuator activated

The following conditions must be observed for the PME75.231Ax program sequence with the actuator function deactivated:

- The *pneumatic combustion control* operating mode must be switched off.  
Parameter 560 = 0
  - If an input signal is present at the 3-position step inputs for load controller OPEN at terminal X5-03 pin 3 or load controller CLOSED at terminal X5-03 pin 2, a mains voltage signal may be issued at the actuator high-fire terminal X2-09 pin 3 and actuator low-fire terminal X2-09 pin 2 outputs, see table below:

Output request		Actuator control response	
Load controller OPEN (Terminal X5-03 pin 3)	Load controller CLOSED (Terminal X5-03 pin 2)	Actuator low-fire (Terminal X2-09 pin 2)	Actuator high-fire (Terminal X2-09 pin 3)
OFF	OFF	OFF	OFF
OFF	ON	ON	OFF
ON	OFF	OFF	ON
ON	ON	ON (prio)	OFF

## Warning!

**Warning:** In applications without an actuator, no other components may be connected at the actuator control outputs (terminal X2-09 pin 1...4). To ensure protection against electric shock hazards, all unused connections must be fitted with corresponding AGG plugs (see basic documentation LME75/LME76 (P7156) chapters *Safety notes* and *Installation notes*).

## 9.4 Ignition transformer terminal X4-02

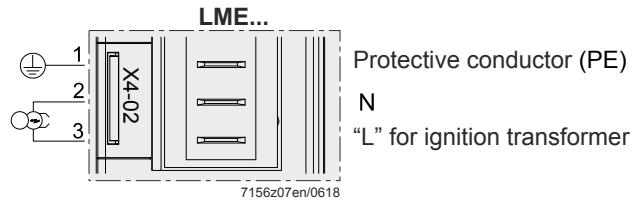

Figure 31: Ignition transformer terminal X4-02

Parameter	Function
201	Fuel train 0 = direct oil ignition 1 = gas pilot ignition
295	Postignition time (t3n)

Output for the connection of ignition transformers or electronic ignition modules.

### Note!

It is only permitted to extend the postignition time (t3n) (parameter > 0 seconds) for directly ignited burners. The postignition time (t3n) (parameter = 0 seconds) must not be extended for burners with a separate gas pilot burner (in accordance with EN 676).

## 9.5 Safety valve terminal X6-03

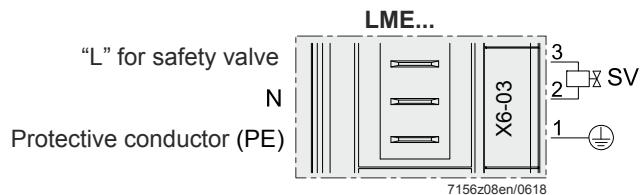

Figure 32: Safety valve terminal X6-03

Output for connection of a safety valve, e.g., for liquefied gas.

### Note!

The safety valve is only active if a heat request (load controller ON/OFF) is present at terminal X5-01 pin 3.

## 9.6 Pilot valve PV terminal X7-04

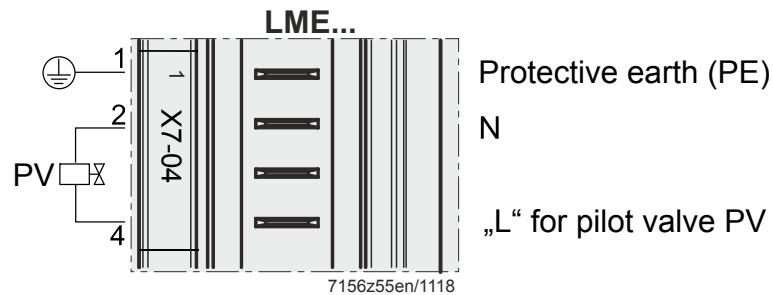

Figure 33: Pilot valve PV terminal X7-04

Parameter	Function
201	Fuel train 0 = direct oil ignition 1 = gas pilot ignition
270	Interval (t4): Stabilization time pilot flame
271	Interval (t9): Second safety time
272	Interval (t5): Stabilization time main flame
295	Postignition time (t3n)

Output for connection of the pilot valve, depending on the fuel train selected.

## 9.7 Fuel valve V1 terminal X7-02

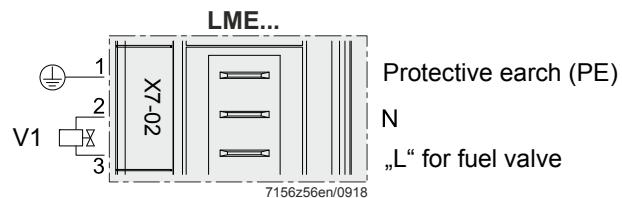

Figure 34: Fuel valve V1 terminal X7-02

Parameter	Function
270	Interval (t4): Stabilization time pilot flame
271	Interval (t9): Second safety time
272	Interval (t5): Stabilization time main flame

Output for connection of fuel valve depending on the fuel train selected.

## 9.8 Fuel valve V2a terminal X7-01

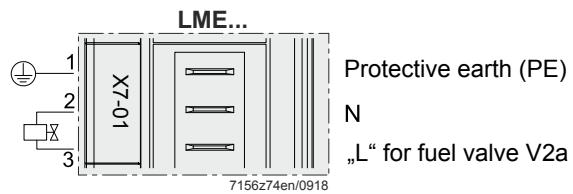

Figure 35: Fuel valve V2a terminal X7-01

Parameter	Function
270	Interval (t4): Stabilization time pilot flame
271	Interval (t9): Second safety time
272	Interval (t5): Stabilization time main flame
563	Operating mode of the ratio control 0 = modulating 1 = multistage

Output for connection of fuel valve depending on the fuel train selected.

**Note!**

In the case of 2-stage applications, the switching contact on the connected actuator switches fuel valve V2a on terminal X7-01.

Please note the maximum permissible contact rating for the connected switching cam within the actuator in use, or the maximum permissible contact rating for terminal X7-01:

Rated voltage	120 V AC 50/60 Hz	230 V AC 50/60 Hz
Rated current	1 A	1 A
Power factor	$\cos\varphi > 0.4$	$\cos\varphi > 0.4$

Parameter number	Function	Factory setting
201	Fuel train 0 = direct oil ignition 1 = gas pilot ignition	0
215.00	Response when opening the safety loop (safety loop failure) 0 = safety shutdown and start prevention 1 = safety shutdown followed by non-alterable lockout	1
215.01	Tolerance time for the <i>safety loop during heat request</i> (start of startup sequence after standby)	4.704 s
216	Extraneous light tolerance time in standby	30 s
217.01	Flame signal flame-out response time (extension) 0 = maximum 1 second with ionization probe $\geq 0$ = additional extension to response to a flame fault	1.911 s
218	Time for controlled intermittent operation	83640.01 s
220	Response to extraneous light in standby or extraneous light test in the prepurging 0 = start prevention 1 = non-alterable lockout	1
264	Specified time for the air pressure switch	12.348 s
265.00	Prepurge time (t1)	24.255 s
265.01	Multiplicator for prepurge time (t1) (extension of the prepurging)	1
266.00	Preignition time (t3)	0 s
266.01	Multiplicator for preignition time (t3) (extension of the preignition)	1
267	Safety time (TSA)	4.116 s
270	Interval (t4): Stabilization time pilot flame	2.352 s
271	Interval (t9): Second safety time	4.704 s
272	Interval (t5): Stabilization time main flame	2.352 s
274.00	Postpurge time (t8) (no extraneous light test)	19.404 s
274.01	Multiplicator for postpurge time (t8) (extension of the postpurge process)	1

Parameter number	Function	Factory setting
275.00	Air pressure switch input 0 = No evaluation of the air pressure switch 1 = Evaluation of the air pressure switch from fan motor ON	1
275.01	Air pressure switch – response time to loss during operation 0 = typically 0.7 seconds $\geq 0$ = additional delay in response to faulty air pressure switch	0.294 s
276	Input pressure switch-min 0 = inactive (no evaluation) 1 = active (evaluation from preignition time [t3])	0
277	Input for pressure switch-max 0 = inactive (no evaluation) 1 = active (evaluation from preignition time [t3])	0
279	Controlled intermittent operation after 24 hours of continuous operation 0 = OFF 1 = ON	0
280	<ul style="list-style-type: none"> <li>Flame supervision with ionization probe: Restart at loss of flame during interval (t4) and second safety time (t9)</li> <li>Flame supervision with QRA7/QRI: Restart at loss of flame during interval (t5) and in operation</li> </ul> 0 = no restart 1 = no restart 2...255 = 1...254 x restart	0
285.00	Function input for terminal X2-02, oil temperature limiter / POC 0 = inactive 1 = POC input (valve closing control) 2 = Oil temperature limiter input	0
285.01	Evaluation of the oil temperature limiter 0 = inactive during operation 1 = active during operation	0
295	Postignition time (t3n)	0 s
298	Opening time of actuator (timeout)	67.914 s
299	Closing time of actuator (timeout)	67.914 s

Parameter number	Function	Factory setting
515.00	Actuator position during postpurge time 0 = Postpurging in low-fire 1 = Postpurging in high-fire	1
515.01	Actuator control 0 = OFF 1 = ON   Note! Setting = 0 No actuators may be connected and parameter 560 must be set to 0.	1
560	Pneumatic combustion control 0 = OFF / 3-position step modulation 1 = PWM fan motor / analog modulation   Note! Setting = 1 No function. This selection puts the LME75 in lockout position.  2 = Air damper / analog modulation (ASZxx.3x feedback required)	0
563	Operating mode of the ratio control 0 = modulating 1 = multistage	1
654	Only with analog modulating (parameter 560 = 2) Analog input (ASZxx.3x feedback required) 0 = 3-position step input 1 = 0...10 V 2 = 0...135 Ω 3 = 0...20 mA 4 = 4...20 mA with a non-alterable lockout at I < 4 mA 5 = 4...20 mA without a non-alterable lockout at I < 4 mA	0

## Key

FFRT	Flame failure response time
tw	Waiting time
TSA	Startup safety time
TSB	Operation safety time
t1	Prepurge time
t3	Preignition time
t3n	Postignition time parameter 295
t4	Interval (t4): Stabilization time pilot flame
t5	Interval (t5): Stabilization time main flame
t8	Postpurge time
t9	Interval (t9): Second safety time
t10	Specified time air pressure switch message (timeout)
t11	Opening time of actuator (timeout)
t12	Closing time of actuator (timeout)
t22	Second safety time
1)	Flame-out response time with loss of flame
2)	Response time to a change of signal by the inputs (e.g., pressure switch-min)
3)	Flame detection time
4)	Response time to a change of signal at the input to the air pressure switch during operation

K...                Relay contact

LED                3-color signal lamp

LP                 Air pressure switch

LR                 Load controller

LR-OPEN            Load controller OPEN position

LR-CLOSED        Load controller CLOSED position

M                 Fan motor

NT                 Power supply unit

Pmax               Pressure switch-max

Pmin               Pressure switch-min

POC                Valve closing control (proof of closure)

PV                 Pilot valve

QRA7               UV flame detector

QRI                Infrared flame detector

R                 Control thermostat or pressurestat

SA                 Actuator

SA-KL               Actuator low-fire

SA-NL               Actuator high-fire

SA-R                Actuator feedback

SA-CLOSED        Actuator CLOSED

SA-ZL               Actuator ignition load

SK                 Safety loop

SV                 Safety valve

V1                 Fuel valve

V2a                Fuel valve

Z                 Ignition transformer

                Input/output signal 1 (ON)

                Input/output signal 0 (OFF)

                Permissible input signal 1 (ON) or 0 (OFF)

# 15 Table of Figures

Figure 1: Program sequence for fuel train LO → Lockout position, standby, and startup .....	8
Figure 2: Program sequence for fuel train LOgp → Lockout position, standby, and startup .....	9
Figure 3: Program sequence for fuel train LO + LOgp → Multistage operation and shutdown .....	10
Figure 4: Program sequence for fuel train LO + LOgp → Multistage operation and shutdown .....	11
Figure 5: Program sequence for fuel train LO + LOgp → Multistage operation and shutdown .....	12
Figure 6: Fuel train direct ignition with light oil (LO), 1-stage .....	15
Figure 7: Fuel train direct ignition with light oil (LO), 2-stage .....	16
Figure 8: Fuel train direct ignition with light oil (LO), modulating, with actuator, without shutdown facility for adjustable head .....	17
Figure 9: Fuel train direct ignition with light oil (LO), modulating, with actuator, with shutdown facility for adjustable head .....	18
Figure 10: Fuel train light oil with gas pilot burner (LOgp) (in accordance with EN 676) .....	19
Figure 11: Air pressure switch terminal X3-02 .....	20
